

Lecture 13

Acceptance and Success Factors in Mobile Business

Mobile Business I (WS 2015/16)

Prof. Dr. Kai Rannenberg

Deutsche Telekom Chair of Mobile Business & Multilateral Security Johann Wolfgang Goethe University Frankfurt a. M.

Acceptance and Success Factors Motivation

- Which factors are important for acceptance and success in M-Business?
- ?

- Building customer trust
- Acceptance of technologies in a market
- Diffusion of M-Business applications and services
- ... and why it is important to understand these factors?
 - Need for understanding the customers' choices for using/not using M-Business applications and services and

to tailor such services to their actual needs.

Consumer Acceptance

- Mobile applications and services in M-Business can increase the connectedness of their users.
- However, there are several issues related to consumers' acceptance for mobile services and applications, which need to be considered:
 - Willingness to pay for services
 - Network effects
 - Ease of Use
 - Quality of service
 - Product limitations
 - Trust in service provider
 - **-** ...

User Trust in M-Business

- Trust Development Life Cycle
- Framework for Building Trust in M-Business
- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

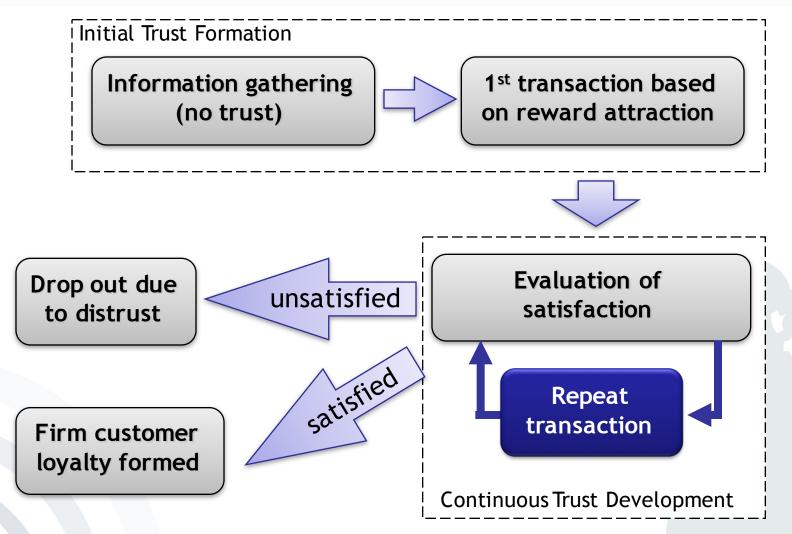

Definition: Trust

- "A state involving confident positive expectations about another's motives with respect to oneself in situations entailing risk" [BoHo91].
- The definition highlights three characteristics of trust:
 - 1. Trust relationships involves two parties: *trustor* & *trustee*.
 - 2. Trust involves uncertainty and risk.
 - 3. The trustor has faith in the trustee's honesty and believes the trustee will not betray him.

Trust Development Life Cycle

mobile Components of Customer Trust in M-Business

Customer Trust in Mobile Mobile Service Provider **Technology** Mobile Business

- Reliability and security of mobile technology are equally important, since failures in the early stages of the usage of M-Business reduce the customers trust significantly.
- As mobile technology evolves, the trust focus shifts from technology to the mobile service provider.

Initial Trust Formation

- In order to build an initial trust formation, service providers must disseminate information, cultivate interest, etc.
 - Enhance customer familiarity, as people tend to trust the familiar, e.g. by general publicity or advertisements.
 - Build vendor reputation, as a good reputation suggests certainty and less risk in conducting business.
 - Deliver high-quality information, as the information posted on a company has a high impact on the customers' perception.
 - Elicit third-party recognition and certification, as the independent nature of third-party certification helps customers to feel more secure in doing business with the M-Business provider.
 - Provide attractive rewards, such as free trials or gift cards helping to attract new customers.

Continuous Trust Building Overview

- It is important to maintain a trust relationship, as creating trust is timeconsuming and trust can easily be destroyed.
- There are several successful methods derived from E-Business that can be adopted by M-Business companies to overcome trust barriers.

Continuous Trust Building **Details 1**

Improve site quality:

User-friendly design of web-sites accessed by mobile devices (e.g. giving customers sufficient information for purchases) helps to convey the vendor's competence.

Sharpen business competence:

 Refers to the skills, technical knowledge, and expertise in operating M-Business applications.

Maintain company integrity:

 Providers need to be congruent with regard to the actions and the promises given to their customers.

Post privacy policy:

- Similar to E-Business providers, M-Business providers should post their privacy policy online, so customers are informed about the information being processed
- Helps to build transparency.

Continuous Trust Building Details 2

Strengthen security controls:

 In order to have secure M-Business transactions, technologies need to be in place that help to allow Multilateral Security for all involved parties.

Foster a Virtual Community:

 By building virtual communities, mobile service providers can replicate the success of web-based online communities and create positive evaluations by their users.

Encourage communication and increase accessibility:

 In order to build synergies, the users should be brought into close communication with the M-Business provider, reducing information asymmetries and fostering the provider's credibility and trustworthiness.

Use external auditing to monitor operations:

 External auditing helps to maintain the customers' trust by keeping the provider to behave fair and legally.

A Framework for Building Trust in M-Business

- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

Diffusion of Technology Introduction

- What makes a product successful compared to another product?
- How does it get accepted in the market?
- There are different models to explain the diffusion of a technology into the market:
 - Theory of Reasoned Action (TRA) [Ajzen1980]
 - Technology Acceptance Model (TAM) [Davis1989]
 - Roger's Diffusion of Innovations (DOI) [Rogers2003]

Diffusion of Technology Basic Terminology

- The adoption (process) is a sequence of stages a potential adopter goes through before accepting a new product or service.
- Diffusion is the process by which an innovation is communicated through certain channels over time among the members of a social system. In other words, diffusion refers to the accumulated level of users of an innovation in a market.
- Innovation (process) is the adoption of an idea or behaviour (whether a system, policy, program, device, process, product, or service), that is new to the adopting organisation.
- Adoption is interpreted as the decision to purchase while acceptance refers to the decision to use the product.

- User Trust in M-Business
 - Trust Development Life Cycle
 - Framework for Building Trust in M-Business
- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

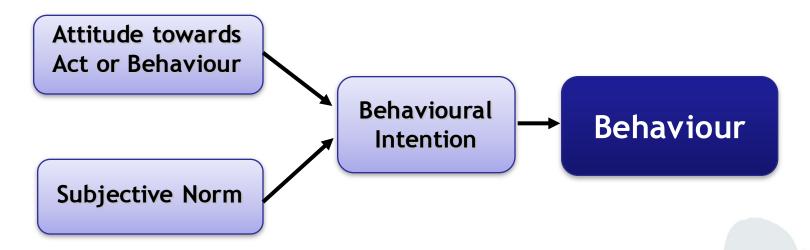

Theory of Reasoned Action (TRA) Introduction

 TRA posits that individual behaviour is driven by behavioural intentions.

The actual use of an innovation is determined by the individual's behavioural intention to use it.

Schematics of TRA

 Behavioural intentions are a function of an individual's attitude towards the behaviour and the subjective norm surrounding the performance of the behaviour.

Attitude towards the Behaviour & Subjective Norm

- Attitude towards the behaviour are the individual's positive or negative feelings about performing a behaviour, determined through an assessment of one's beliefs.
- Subjective norm is defined as an individual's perception of whether people who are important to this individual think the behaviours should be performed.

Limitations of TRA

- Significant risk of confounding between attitudes and norms since attitudes can often be reframed as norms and vice versa.
- Assumption that when someone forms an intention to act, they will be free to act without limitation, is often unfounded.
- In practice, constraints such as limited ability, time, environmental or organisational limits, and unconscious habits will limit the freedom to act.

- User Trust in M-Business
 - Trust Development Life Cycle
 - Framework for Building Trust in M-Business
- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

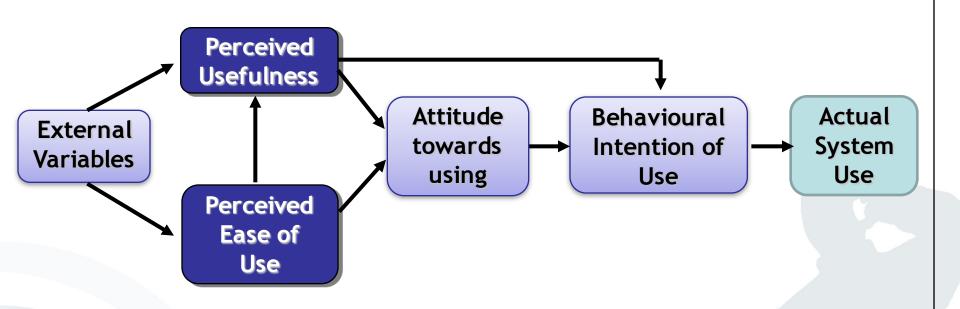

Technology Acceptance Model (TAM) Introduction

- The Technology Acceptance Model (TAM) by Davis [Davi89] is based on the Theory of Reasoned Action (TRA).
- Tailored towards the acceptance of information technology
- A key purpose of TAM is to provide a basis for tracing the impact of external variables on internal beliefs, attitudes and intentions.
- Two main factors are of prime relevance in explaining system use:
 - "Perceived ease of use"
 - "Perceived usefulness"

Technology Acceptance Model Schematic

Technology Acceptance Model Main Factors

Perceived usefulness:

 The degree to which a person believes that using a particular system would enhance his or her job performance

Perceived ease-of-use:

 The degree to which a person believes that using a particular system would be free from effort

Technology Acceptance Model Use of the Model

- Researchers have simplified TAM by removing the attitude construct found in TRA from the current specification (e.g. [VMDD03]).
- Attempts to extend TAM have generally taken one of three approaches:
 - 1. Introducing factors from related models
 - Introducing additional or alternative belief factors (risk, emotion, etc.)
 - 3. Examining antecedents and moderators of perceived usefulness and perceived ease of use

Technology Acceptance Model Limitations

- Both TRA and TAM have strong behavioural elements, assuming that when someone forms an intention to act, they will be free to act without limitation.
- In practice constraints such as limited ability, time, environmental or organisational limits, and unconscious habits will limit the freedom to act.

- User Trust in M-Business
 - Trust Development Life Cycle
 - Framework for Building Trust in M-Business
- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

Diffusion of Innovations (DOI) Introduction

- Diffusion is the process by which an innovation is accepted by a social system, e.g. the market.
- The *rate of diffusion* is the speed of the new idea spreading from one consumer to the next.
- Adoption is similar to diffusion except that it deals with the psychological processes an individual goes through, rather than an aggregate market process.
- Diffusion of Innovations theory especially focuses on the following topics:
 - Adopters
 - Key innovation characteristics
 - Stages of adoption

Diffusion of Innovations Categories of Adopters

Adopters can be categorised in 5 different groups:

- 1. Innovators
- 2. Early adopters
- 3. Early majority
- 4. Late majority
- 5. Laggards

Diffusion of Innovations Categorisation of Adopters 1

Innovators (2,5%):

- Characteristics: Venturesome, educated, multiple info sources, greater propensity to take risk
- ⇒ Has the ability to understand and apply complex technical knowledge and can cope with a high level of uncertainty of an innovation.
- The innovator is a catalyst who brings about the use and adoption of new ideas.

Early adopters (13,5%):

- Characteristics: Social leaders, popular, educated
- Other members of the group look to these individuals for advice and knowledge about the innovation.

Diffusion of Innovations Categorisation of Adopters 2

- **•** *Early majority (34,0%):*
 - Characteristics: Deliberate, many informal social contacts
 - → Tend to adopt the innovation just prior to time the average individual adopts it (link between early adopters and later majority).
- Late majority (34,0)%:
 - *Characteristics:* Sceptical, traditional, lower socio-economic status
 - Acceptance comes after the average person accepts
- Laggards (16,0%):
 - Characteristics: Neighbours and friends are main info sources, fear of debt
 - Laggards are those who are consistent or even adamant in resistance to change.

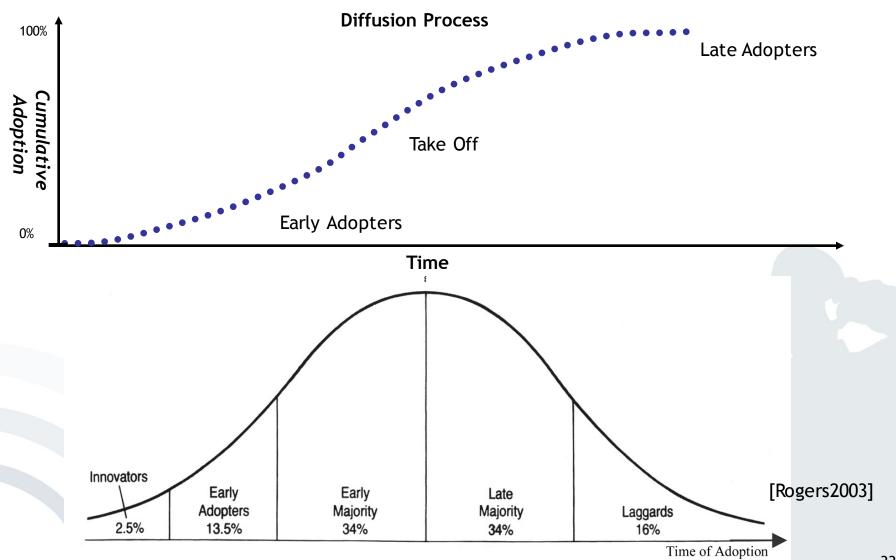

Does the categorisation of the adopters made by Rogers apply to the M-Business market?

Diffusion of Innovations Adopter Bell Curve

Diffusion of Innovations Key Innovation Characteristics

Relative Advantage:

 The degree to which the innovation is perceived as being better than the practice it supersedes

Compatibility:

 The extent to which adopting the innovation is compatible with what people do

Complexity:

 The degree to which an innovation is perceived as relatively difficult to understand and use

Trialability:

 The degree to which an innovation may be experimented with on a limited basis before making an adoption (or rejection) decision

Observability:

The degree to which the results of an innovation are visible to others

Key Innovation Characteristics Example Mobile Telephony

Relative Advantage:

- Availability/reachability of the subscriber
- Communicate (almost) anywhere / anytime
- Personal device(s)

Compatibility:

 High compatibility in society, as flexibility and reachability get more and more important.

Complexity:

- Low to medium:
 - Basic functionality (e.g. telephony) can be used by everyone being capable of using a standard, fixed-line telephone.
 - Advanced features (e.g. SMS) need further training to use them.

Key Innovation Characteristics Example Mobile Telephony

Trialability:

 High: A potential customer can subscribe to a prepaid contract for testing the technology and later on switch to a "normal" subscription based contract.

Observability:

- Reachability of the customers anytime and anywhere.
- More and more people are using mobile phones and services.
- People using mobile phones can easily be observed by nonusers.
- The concept and benefit of mobile telephony is easily observable by non-users.

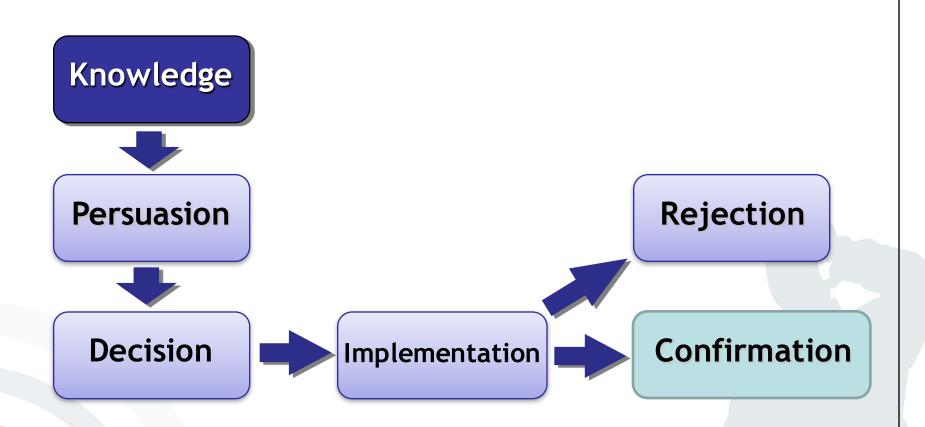

Five Stage Model for the Diffusion of Innovation

- The adoption of an innovation includes the following stages:
 - 1. Knowledge: Learning about the existence and function of the innovation
 - 2. Persuasion: Becoming convinced of the value of the innovation
 - 3. **Decision:** Committing to the adoption of the innovation
 - 4. Implementation: Putting it to use
 - **5. Confirmation:** The ultimate acceptance (or rejection) of the innovation

Diffusion of Innovations Stages of Adoption

General Model of Technology Acceptance based on TRA and DOI

Behavioural beliefs about adopting/using the technology

- relative advantage
- compatibility
- complexity
- trialability
- observability
- image
- trust

Normative beliefs about adopting/using the technology

- friends
- work group
- family
- other opinion leaders

Attitude towards adopting/using the technology

Subjective

norm towards adopting/using

the technology

Behavioural intention to adopt/use technology

Actual adoption/ use of technology

[BarnesHuff2003]

- User Trust in M-Business
 - Trust Development Life Cycle
 - Framework for Building Trust in M-Business
- Diffusion of Technology
 - Theory of Reasoned Action (TRA)
 - Technology Acceptance Model (TAM)
 - Diffusion of Innovations (DOI)
- Case Study: i-mode vs. WAP

Case Study i-mode vs. WAP

- Currently, the separate technologies of (stationary) Internet and mobile telephony converge more and more, allowing new business models to emerge.
- However, by comparing the (more or less successful) adoption of (similar) technologies, one can observe major differences in the customers' adoption behaviour.
- Examples:
 - i-mode (in Japan and Germany)
 - WAP (in Germany)

Mobile Multimedia Service i-mode History

- Established in February 1999 by NTT DoCoMo in Japan as a service for mobile Internet access.
- Proprietary standard, based on package-based data transmission.
- Requires special i-mode devices
- Advantage: "Always-online"functionality without continuous charging.

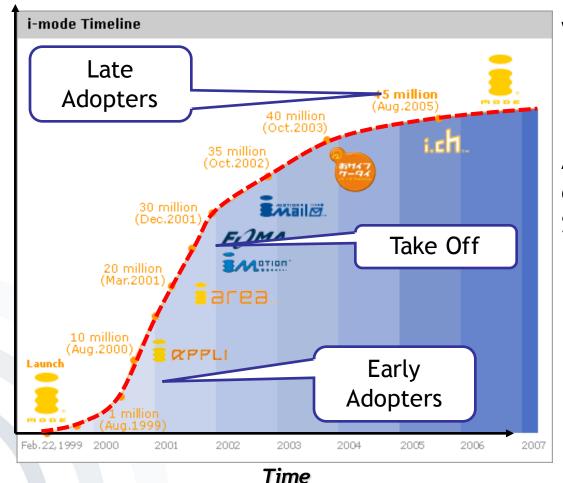

Wireless Application Protocol (WAP)

- **W**Forum
- In 1997, Ericsson, Motorola, Nokia and Unwired Planet founded the WAP-Forum.
- The WAP-Forum is a non-profit organization with the objective to build up an open standard (protocol) for wireless data-communication.
- More than 300 members worldwide (manufacturers, software industry, computer and telecommunication companies & network-operators)
- Protocol family, developed by the WAP-Forum to provide internet contents on mobile devices
- Universal use, independent from used network technology (GSM, UMTS, etc.)

Cumulative Adoption

i-mode User Base Development and Diffusion Process

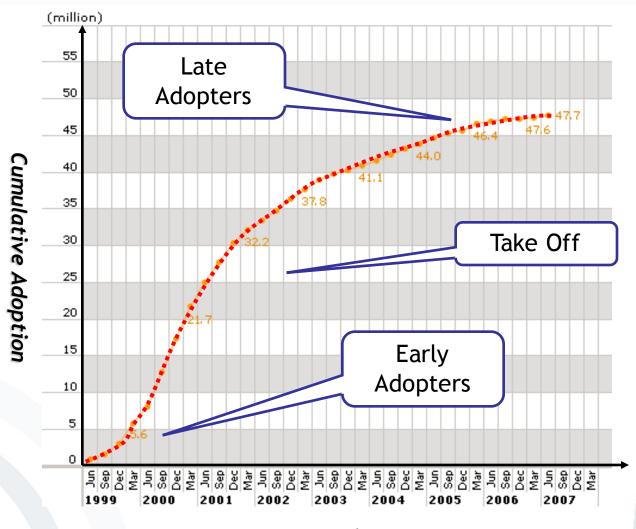

Worldwide about 45 million users (2/2006)

Adoption of i-mode is characterised by an S-shaped curve!

[Nttdocomo2007]

i-mode User Base Development

Time

i-mode User Base Germany

 Number of users in Germany at the beginning of 2003, according to e-plus:

Planned: 750.000

Achieved: 125.000

[eplus03]

 Mobile Internet Services Penetration in Germany (number of users):

500.000

4.500.000

5.500.000

[Handelsblatt 2/2004]

E-plus shut down i-mode on 1st of April 2008

Key Innovation Characteristics WAP 1

Relative advantage:

- WAP provides an access channel to many special Internet pages
 - using the Wireless Markup Language (WML)
 - bringing information to mobile devices.
- However, only a limited amount of content is available.

Compatibility:

- High compatibility to previous user experiences, as WAP is based on mobile telephone handsets
- familiarity
- However, the displayed WAP pages are only of limited quality:
 - user interfaces lack quality,
 - connection-speeds are low

Key Innovation Characteristics WAP 2

Complexity:

 Medium complexity, as WAP is intuitive to use - depending on the browser software used.

Trialability:

- Low initial costs, as WAP is based on a pay-per-use schema
- Therefore it offers a high level of trialability.

Observability:

- The observability can be enhanced through non-customers watching customers using WAP.
- However, due to limited content and high prices, not many customers use WAP.

Key Innovation Characteristics i-mode 1

Relative advantage:

- i-mode provides a direct Internet access channel to many individuals for whom the Internet was inaccessible previously, as
 - fixed-line Internet was not widely available
 - people were not much at home anyway.

Compatibility:

- High compatibility to previous user experiences, as i-mode is based on mobile telephone handsets
- familiarity
- Also i-mode is highly compatible with the Japanese cultural values
- Enthusiasm for electronic devices

Key Innovation Characteristics i-mode 2

Complexity:

- Low complexity, as i-mode has an intuitive and easy to use interface, command set, and navigation
- i-mode uses an Internet browser, which is a scaled-back version of traditional desktop browsers, allowing its user to easily use this innovation.

Trialability:

- Low initial costs, as i-mode is based on a per-use tariff-scheme
- Therefore it offers a high level of trialability.
- Subscribers can easily share their devices for trials.

Observability:

- i-mode is highly interactive, and interactions can also be seen on the Internet.
- Also the observability can be enhanced through others, witnessing people using i-mode.

Other factors affecting i-mode adoption and use

Market situation:

- NTT DoCoMo is the market leader with a 60% market share in mobile communications.
- Furthermore, NTT DoCoMo stock majority is owned by the Japanese government.
- Low penetration of stationary internet connections.

Vertical integration:

 NTT DoCoMo has a strong position in the mobile value chain, being vertically integrated into chip, handset, and infrastructure research and development.

Network investment:

 NTT DoCoMo has invested proactively into 3G infrastructure (especially packet radio overlay systems) one year ahead of their competitors.

Self-reinforcing service:

There is a "connection" between voice and data services, as customers tend to use more voice services when they use the imode data service (change in consumer behaviour).

Transferability of i-mode from Japan to Germany? A Summary

Japan (ca. 2000):

- Low penetration of stationary internet connections
- 77.000 content-providers
- Commuting
- Service-Level
- Low penetration of SMS iMode offering cheap messaging
- "i"-button/ colour-displays
- Willingness to pay for services
- Private subscriber communities for special topics

Germany (ca. 2000):

- Primarily voice + SMS usage
- Only about 160 content providers
- Scepticism towards WAP/imode
- SMS is the "weapon of choice" for mobile messaging.

Reasons for the Failure of WAP Services

- Usage of the term "mobile Internet" for marketing WAP confused customers and nourished wrong expectations towards this technology. Compared with those expectations WAP had:
 - High costs for the content
 - Complex billing system
 - Low speed
 - Low usability
 - ...

- When WAP was rolled out, only a limited amount of devices with WAP-capabilities was available.
- Internet-based providers offering mobile content for free also lowered the demand for WAP services

Conclusion: WAP vs. i-mode

- It is unlikely that i-mode's success in Japan can be transferred to other markets, due to the unique market situation in Japan.
- But key lessons learned from i-mode's success story in Japan include:
 - Importance of a trusted, branded, useful, easy-touse, holistic package of services
 - The value of investment and leveraging of technological infrastructure such as networks and handsets
