

Lecture 11

Design of Mobile Applications

& Services: HCI Issues

Mobile Business II (SS 2023)

Prof. Dr. Kai Rannenberg

Chair of Mobile Business & Multilateral Security Goethe University Frankfurt a. M.

Agenda

- Introduction to HCI
- Mobile Interaction Styles
- Mobile Interaction Design
 - Understanding Users
 - Developing Prototype Designs
 - Evaluation
- Examples: Enhanced App Store, Privacy Guide and App Analyzer

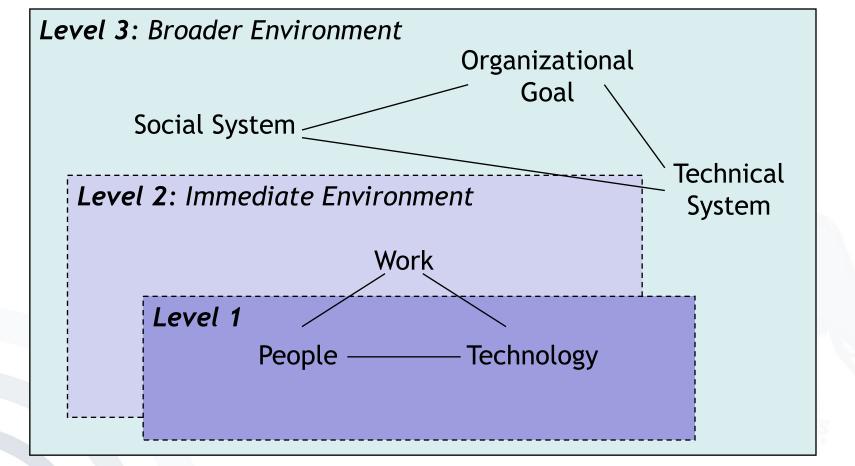

HCI | Definition

"Human-computer interaction is a discipline concerned with the design, evaluation and implementation of interactive computing systems for human use and with the study of major phenomena surrounding them."

[Hewett et al. 1992]

"Human-computer interaction is the scientific study of the interaction between people, computers, and the work environment."

Focus of HCI

ŀ L

Definition of Usability

Usability is the "extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use."

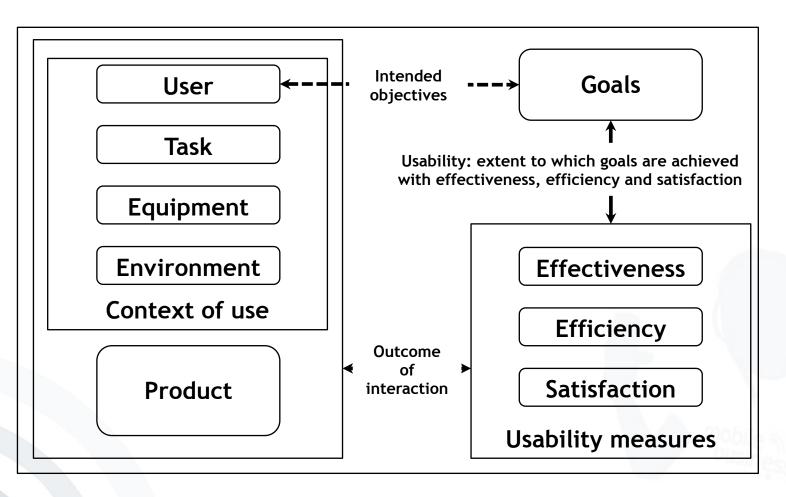

Elements of Usability Definition

- Effectiveness: Accuracy and completeness with which users achieve specified goals.
- Efficiency: Resources expended in relation to the accuracy and completeness with which users achieve goals.
- Satisfaction: Freedom from discomfort, and positive attitudes towards the use of the product.
- Context of use: Users, tasks, equipment (hardware, software and materials), and the physical and social environments in which a product is used.
- User: Person who interacts with the product.
- Goal: Intended outcome.
- Task: Activities required to achieve a goal.
- Product: Part of the equipment (hardware, software and materials) for which usability is to be specified or evaluated.

Usability Framework

Agenda

- Introduction to HCI
- Mobile Interaction Styles
- Mobile Interaction Design
 - Understanding Users
 - Developing Prototype Designs
 - Evaluation
- Examples: Enhanced App Store, Privacy Guide and App Analyzer

Mobile Interaction Styles

The interaction between users and mobile devices is multidimensional:

- Text entry
- Speech input
- Menu navigation
- MultiTouch
- Earcons
- Metaphors

Mobile Interaction Styles Text Entry

Possible interaction via text entry:

- Keyboard entry
- Touch screen
 - Recognition of handwriting
 - Palm-Graffiti
 - Virtual keyboard
 - Swype
- Tegic T9
- Octave
- **.**....

Mobile Interaction Styles Text Entry - Keyboard

- Text entry via classic keyboard solution.
- For higher mobility, keyboards become foldable and virtual.

Adaptation of a traditional text entry concept

- Handwriting recognition software
- Artificial script, based on upper-case characters
- Can be drawn blindly with a stylus on a touch-sensitive panel

Mobile Interaction Styles Text Entry - Touch Screen

Graffiti® Alphabet (.) Heavy dot indicates starting point. Punctuation Shift = tap once (Write ---- to exit a shift mode.) Punctuation Shift = tap once to exit a shift mode.) (Write Extended Shift = Accented Characters Source: Palm, Inc.

MobileMobileMobileInteractionStylesSty

- Virtual keyboard on the screen
- Can be used with a stylus or with fingers

Source: HTC, Inc.

Mobile Interaction Styles Text Entry - Swype

- Swype is an input method for touch screens developed by Swype Inc.
- Available on Samsung, HTC, and also on Android and Symbian.
- Three major components: An input path analyzer, word search engine with corresponding database, and a manufacturer customizable interface.
- Available in >40 languages.

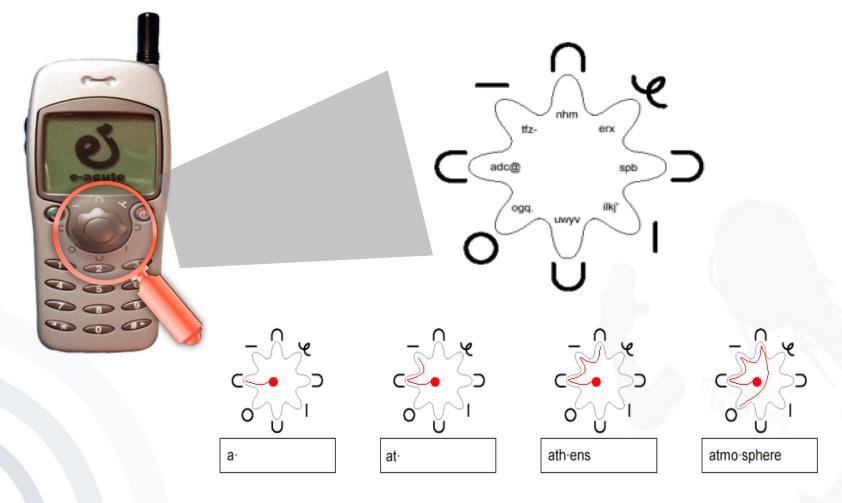

Mobile Interaction Styles Text Entry - Tegic Communications T9

- T9 (*Text on 9 keys*) is a predictive text technology developed by Tegic Communications.
- Widely used by: LG, Samsung, Nokia, Siemens, Sony Ericsson, Sanyo
- Uses a dictionary of words, which is used to look up all the possible words, corresponding to the sequence of keys pressed.
- Available in 27 languages

Mobile Interaction Styles Text Entry - Octave

Text can be entered via key navigation

Mobile Interaction Styles Speech Input

- Speech input relies on speech recognition technologies used by the mobile application.
 - Speaker-dependent Recognition technologies "learns" from a set of sample words spoken by the user (system training).
 - Speaker-independent
 Pre-defined vocabulary that has been set up by a large number of speech samples.

Mobile Interaction Styles Menu Navigation

- Mobile phone applications usually have a hierarchically structured navigation menu providing a list of menu choices.
- Menu hierarchies are often not self-explanatory (switching costs for users).
- Long menu lists can overload the users' short-term memory.

connect your memory card to a computer

You can use a cable connection to access your phone's memory card with a PC.

Note: When your phone is connected to a computer, you can only access the memory card through the computer.

On your phone:

Disconnect the cable from your phone, if it is connected, then press $|\hat{\Phi}\rangle > B$ Settings $|\hat{\Phi}\rangle > B$ Seting Settings $|\hat{\Phi}\rangle > B$

This directs the USB connection to your memory card.

Source: Motorola

Mobile Interaction Styles Touch Screen - Multi-touch

- Input by using gestures
- Up to three (or more) fingers simultaneously

Mobile Interaction Styles Earcons

- Earcons are abstract musical tones that produce sound messages to represent parts of an interface.
- Event-driven:
 - Incoming text messages
 - Alarm clock
 - •••

Menus augmented with earcons can support user navigation.

Mobile Interaction Styles Metaphors

- Interface metaphors work by applying prior knowledge from a familiar to a new domain.
- Goal: Reducing people's perception of the complexity of the device used.

Agenda

Mobile Interaction Design Understanding Users |1

- For an effective interaction design, it is necessary to understand potential users of a system.
- Possible methodologies
 - Field studies (observe and probe a particular group in situations of interest)
 - Laboratory experiments (observe and probe a particular group within a controlled environment)
 - Direct questionnaire (e.g. to validate impressions and interpretations from the field)

Mobile Interaction Design Understanding Users |2

- The user group needs to have a significant impact on the design process.
- User-centered service design can significantly affect the user's perception of mobile devices and services.
- Examples of user characteristics:
 - Spatial ability: dealing with spatial relations and visualization of spatial tasks
 - Verbal ability: comprehend spoken or written words
 - Working memory: limited capacity of short-term memory
 - Previous experience: user's experience with an actual interface used

Agenda

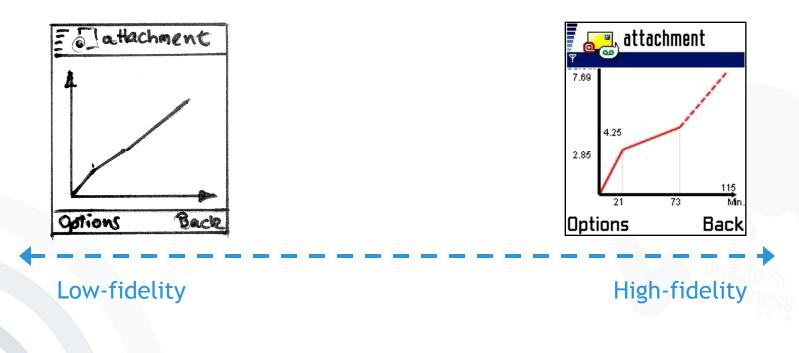

- Introduction to HCI
- Mobile Interaction Styles
- Mobile Interaction Design
 - Understanding Users
 - Developing Prototype Designs
 - Evaluation
- Examples: Enhanced App Store

Mobile Interaction Design Developing Prototype Designs |1

- HCI-Prototypes are built in order to express a design idea as quickly as possible.
- One can differentiate how closely a prototype resembles the appearance of the final product.

Mobile Interaction Design **Developing Prototype Designs |2**

5 attachment Back Options

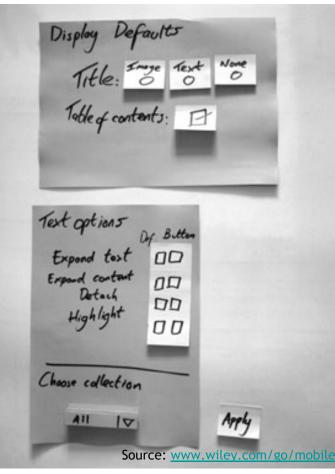

Low-fidelity

The prototype uses materials different to those in the final incarnation.

- Check for inconsistency
- Give a common specification for the design team
- Afford reflection
- Check interaction scenarios

5) attachment

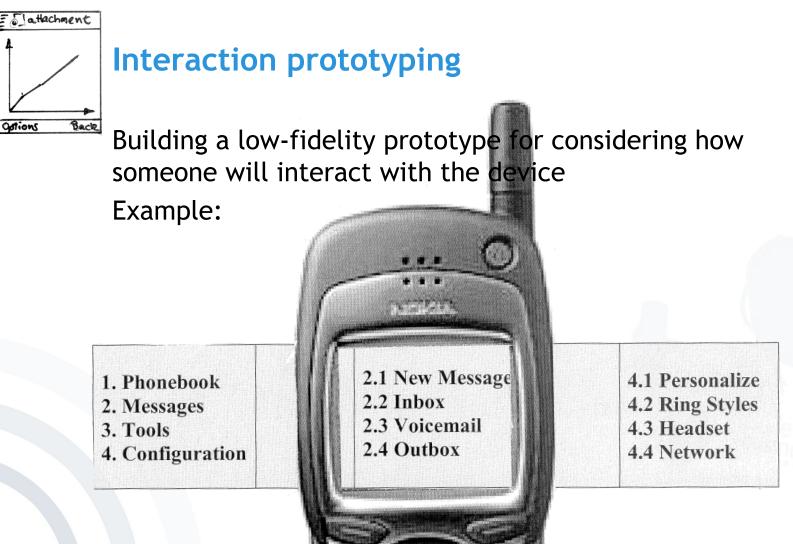

Building a low-fidelity prototype for testing the feasibility of

ideas

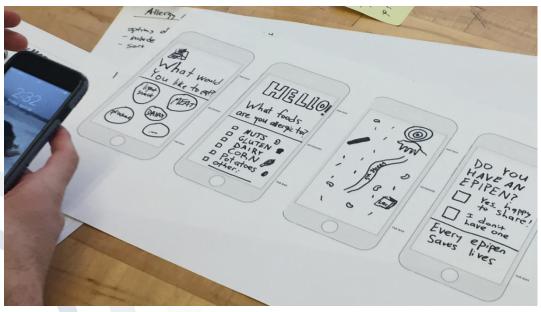

Mobile Interaction Design Low-Fidelity Prototype Designs |3

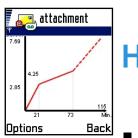

Mobile Interaction Design Low-Fidelity Prototype Designs |4

- New tools massively simplify low-fidelity prototyping
- For example: Pop by Marvel¹
 → sketches can be turned into an interactive iOS or Android prototype

Exemplary use of app: http://vondesign.com/category/drawing

Mobile Interaction Design High-Fidelity Prototype Designs |1

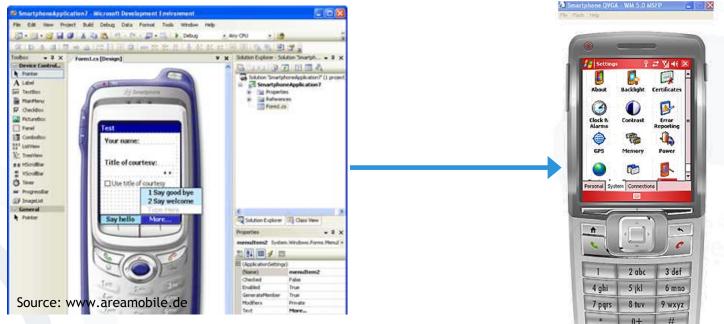

High-fidelity

- The results of a low-fidelity prototyping process comprise a list of features that should be tested with representatives of the target group.
- High-fidelity prototype designs provide the functionality to evaluate critical tasks and functionalities that should be supported by the final product.
- Therefore, most critical features must be identified to be included in the prototype design.

Mobile Interaction Design High-Fidelity Prototype Designs |2

Mobile Interaction Design Key Issues in HCI Prototyping

Туре	Advantages	Disadvantages
Low-fidelity	 Less time Lower costs Evaluate multiple concepts Useful for communication Address screen layout issues 	 Little use for usability test Navigation and flow limitation Facilitator driven Poor detail in specification
High-fidelity	 Partial functionality Interactive User-driven Clearly defined navigation scheme Use for exploration and test Marketing tool 	 Creation time-consuming Inefficient for proof-of-concept Blinds users for major representational flaws Users may think prototype is 'real'

- Introduction to HCI
- Mobile Interaction Styles
- Mobile Interaction Design
 - Understanding Users
 - Developing Prototype Designs
 - Evaluation
- Examples: Enhanced App Store,
 Privacy Guide and App Analyzer

Why evaluation?

- Understanding how users will use the design in the real world,
- Comparing different prototype designs,
- Assessing whether the product to be developed meets usability requirements, and
- Ensuring that the product conforms to industry standards.

- The evaluation of HCI prototype designs can be based on different methodologies addressing different aspects, e.g.:
 - Direct observation
 - Interviews
 - Questionnaires
 - Experiments
 - …

Direct observation

Observe or video users how they use the HCI design in order to check, for e.g. the:

- intuitive and correct usage of the design by the users,
- ability of users to manage pre-defined tasks.
 - Conducted by: End-Users
 - Equipment: Interactive prototype
 - Results: Qualitative
 - Where: Controlled setting

Mobile Interaction Design Evaluation |4

Interviews

- Often made in conjunction with observations
- Provision of direct feedback from the users
- Observed problems can be addressed

- Conducted by: End-Users
- Equipment: Interactive prototype
- Results: Qualitative
- Where: Controlled setting

Questionnaires

- Tool for gathering users' opinions
- Tool for comparing different designs by using quality scales
- Example: I was able to enter text easily
 Disagree [1] [2] [3] [4] [5] Agree
 - Conducted by: End-Users
 - Equipment: Interactive prototype & Questionnaire
 - Results: Qualitative & Quantitative
 - Where: Controlled setting

Experiments

- Usually hypothesis-based

 (e.g. Navigation within application A is quicker than within application B.)
- Results provide insight on how much 'better' a certain design is
 - Conducted by: End-Users
 - Equipment: Interactive prototype
 - Results: Qualitative
 - Where: Controlled setting

- Design shortcomings of products can have different reasons, such as:
 - A lack of user-based evaluation during the design process,
 - Perceived financial costs of better design,
 - An overemphasis on technology over purpose.

Privacy Enhanced App Store Motivation

- Enhance privacy transparency and privacy awareness in app markets.
- ✓ Foster informed choice of apps.
- Integrate more effective privacy risk indicators into app markets.
- Develop and evaluate proof of concept for Google's Play Store.

[BalRannenberg 2014, Bal et al. 2015]

Privacy Enhanced App Store Conclusion

- Result of an experimental user study: better privacy risk communication leads to:
 - increased privacy and risk awareness,
 - better comprehension of risks,
 - better comparison of apps,
 - privacy as a stronger decision factor,
 - safer app choices.

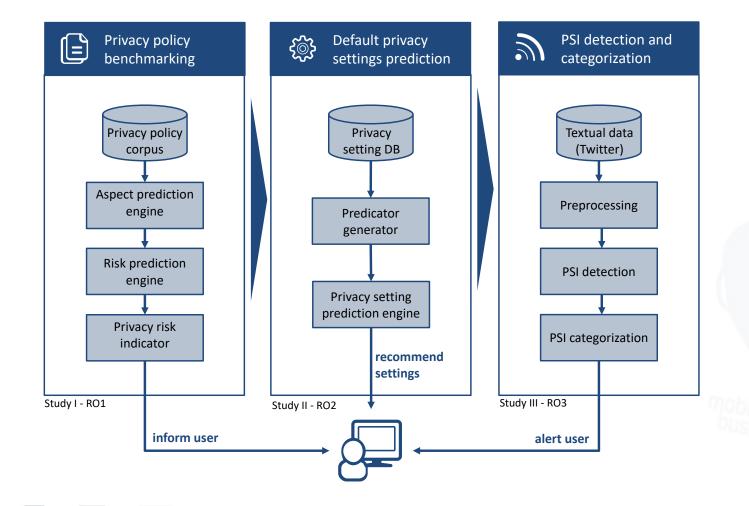

Introduction to the Privacy Guide Problem Description

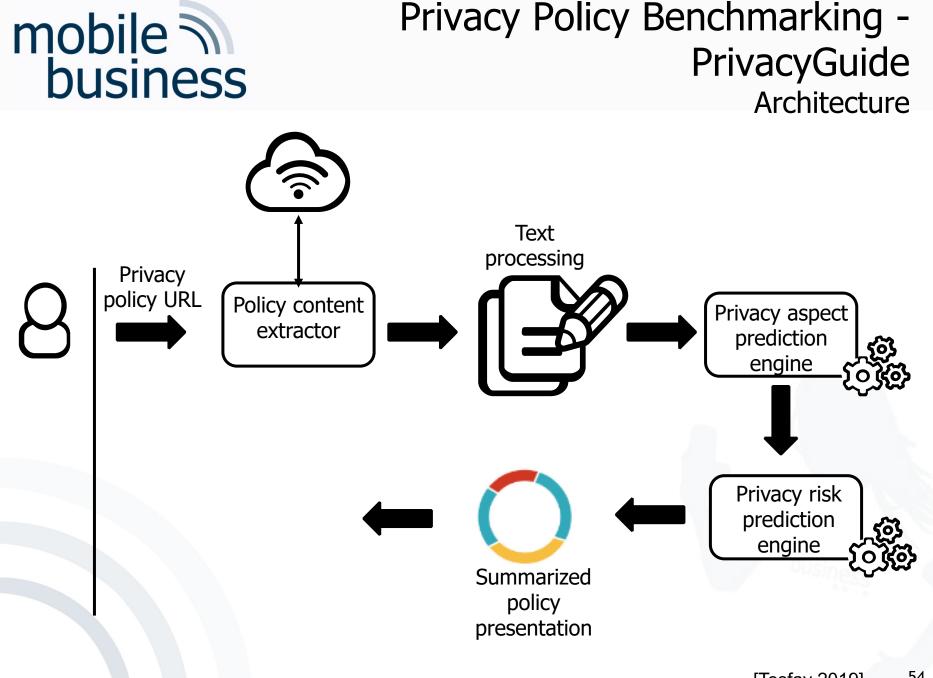

Lack of user-friendly transparency tools, esp. with respect to data processing practices of service providers.
 "Users are often unaware of the information they are sharing, unaware of how it can be used by data collectors or third parties, ...uncertain about their own preferences...." (Acquisti et al., 2015)

- Lengthy privacy settings (Wilson et al., 2016)
- Generic (often) designed for max data sharing

 (Un)intended sharing of privacy sensitive information (PSI) and lack of tools to detect and inform users (Tesfay et al.,2016)
 Discrimination based on PSI disclosure e.g. in hiring processes (Acquisti, A., & Fong, C., 2019; Neumark, 2012)

Outlook - Augmented Reality

- Augmented Reality (AR) often seen as next step in (mobile) interaction
- Pokemon Go can be seen as first popular use case of AR.
- Now AR regularly implemented in vehicles through head-up displays.
- Possible next step: AR glasses

(https://artlabs.ai/blog/the-best-smart-glasses-and-ar-specs-of-2021/)
