Importance of Cybersecurity in the Automotive Industry

Safety of Drivers and Passengers

Modern vehicles are equipped with numerous electronic control units (ECUs) that manage critical functions such as braking, steering, and acceleration. A cyber attack could compromise these systems, leading to potentially dangerous situations.

Protection of Personal Data

Vehicles today collect and store a significant amount of personal data, including location, driving habits, and even biometric information. Ensuring this data is secure is essential to protect the privacy of vehicle owners.

Preventing Unauthorized Access

Hackers gaining access to a vehicle's systems can manipulate its functions, such as unlocking doors or starting the engine, leading to theft or unauthorized use.

Compliance with Regulations

Various global regulations, such as UNECE WP.29 and ISO/SAE 21434, mandate stringent cybersecurity measures for automotive manufacturers. Compliance with these regulations is necessary to avoid legal repercussions and ensure market access.

Maintaining Consumer Trust

As vehicles become more connected and autonomous, consumers need to trust that their vehicles are secure from cyber threats. A breach can significantly damage a brand's reputation and consumer confidence.

Economic Impact

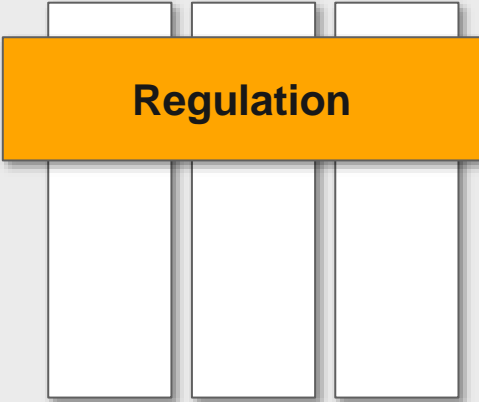

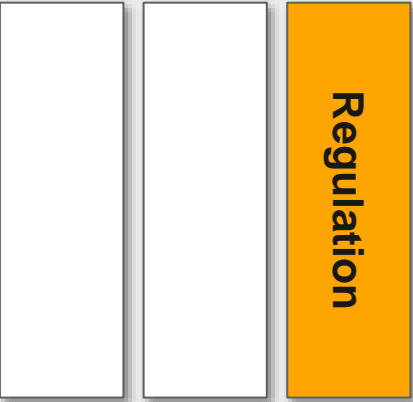

Cyber attacks can lead to significant financial losses due to recalls, legal liabilities, and damage to brand reputation. Investing in robust cybersecurity measures helps mitigate these risks.

Conclusion

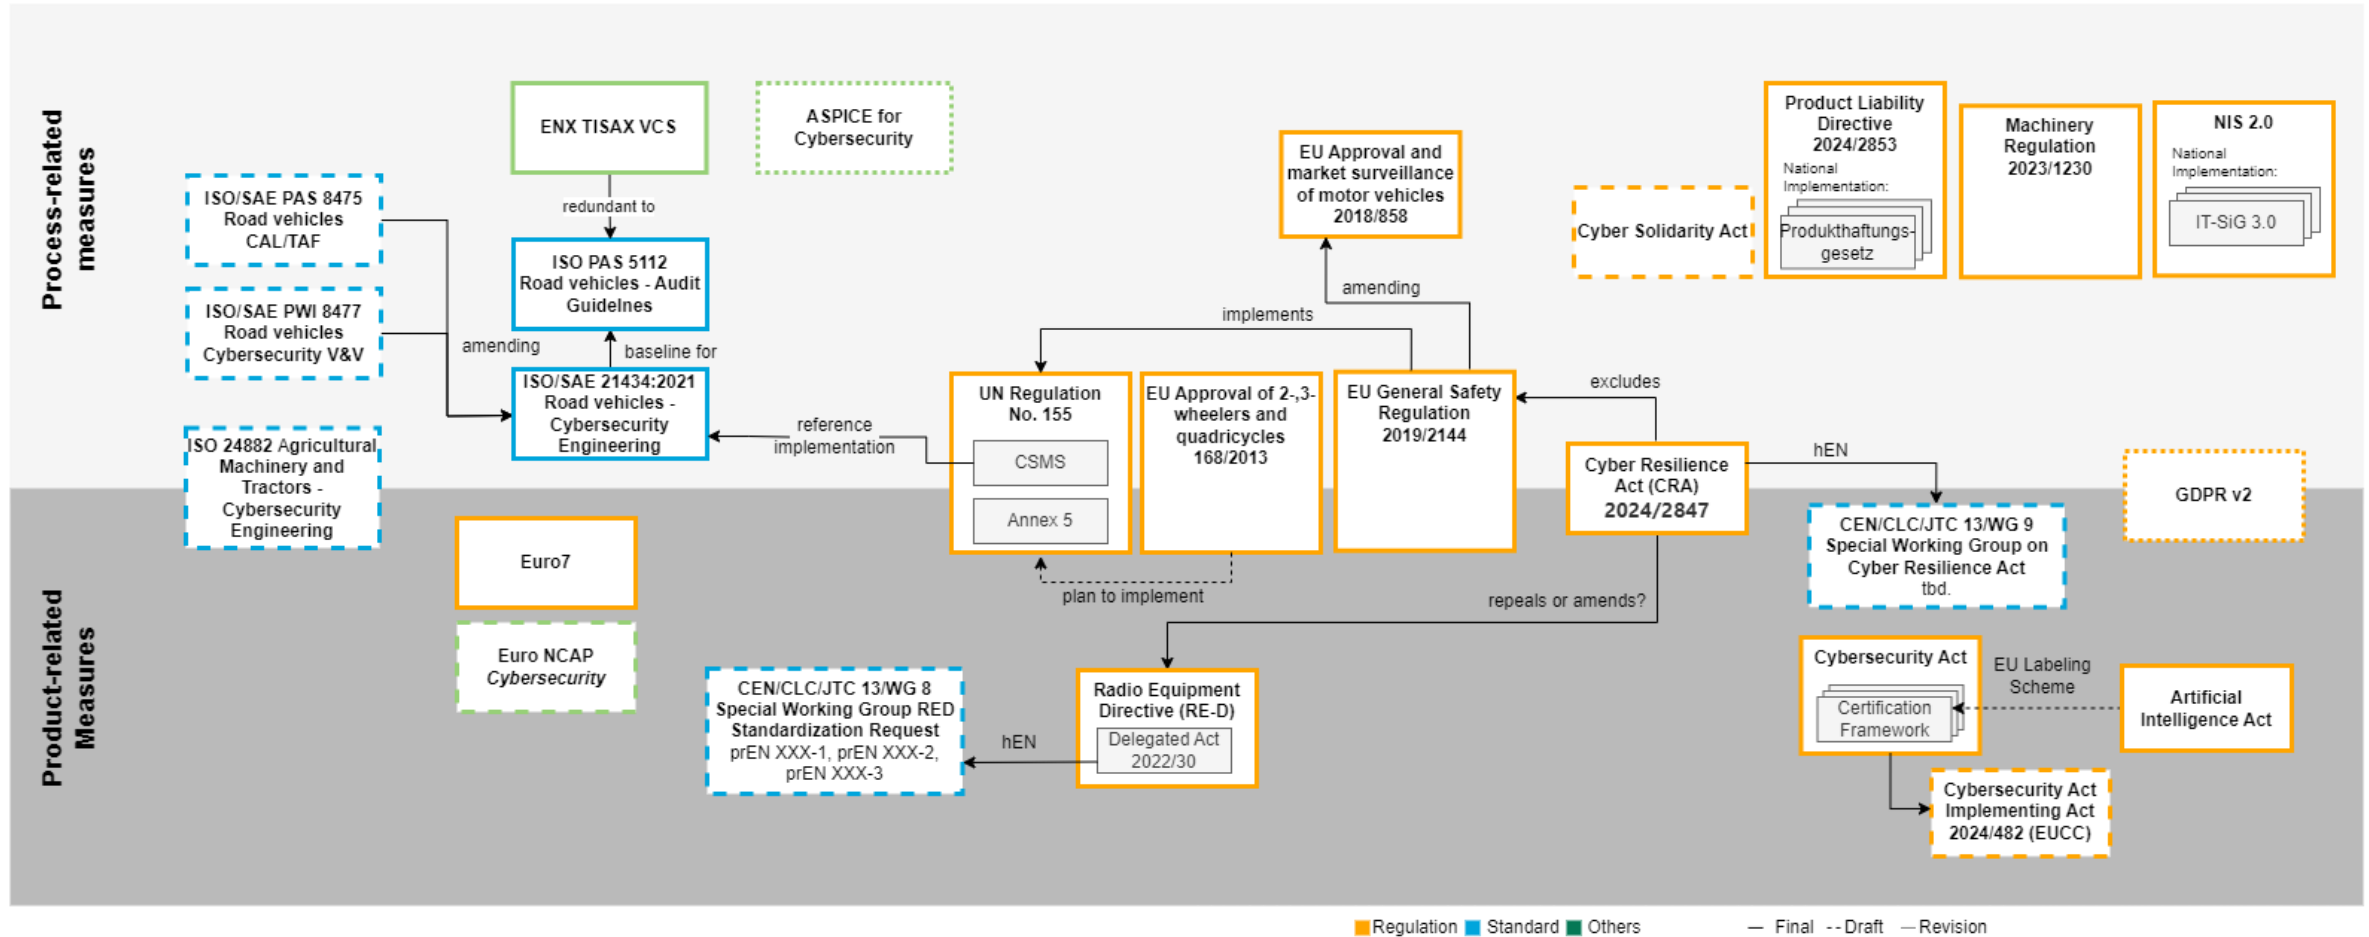

By addressing these aspects, the automotive industry can ensure the safety, privacy, and trust of its consumers while complying with regulatory requirements and protecting its economic interests.

Horizontal and Industry-specific Regulations

Ensure to meet all necessary Compliance Requirements

	Horizontal Regulations	Vertical Regulations
Scope	Broad scope and apply to multiple industry	Narrow and tailored to particular sectors
Focus	Address common issues like data protection and workplace safety	Focus on unique risks and requirements of specific industries
Implementation	Compliance is required across all sectors	Require specialized knowledge and practices relevant to the particular industry
		

Regulations and Standards Impacting European Market Requirements are Process- and Product-related

Horizontal Regulations

General Data Protection Regulation (GDPR)

Regulation (EU) 2016/679

Overview

- › **Purpose:** Protects personal data of EU citizens and regulates data processing activities.
- › **Scope:** Applies to all organizations handling EU citizens' data, regardless of location.

Key Requirements

- › **Consent:** Explicit consent required for data collection and processing.
- › **Data Subject Rights:** Includes right to access, rectify, and erase personal data.
- › **Data Protection Officer (DPO):** Mandatory for certain organizations to oversee compliance.
- › **Penalties:** Fines up to €20 million or 4% of global turnover for non-compliance.

Impact on Automotive Industry

- › **Data Collection:** Vehicles collect extensive personal data (e.g., location, driving habits).
- › **Compliance:** Automotive companies must ensure data protection measures are in place.
- › **Consumer Trust:** Enhances trust by safeguarding personal data and ensuring transparency.
- › **Operational Changes:** Requires updates to data management systems and processes.

EU Cybersecurity Act (CSA)

Regulation (EU) 2019/881

Overview

- › **Purpose:** Establishes a framework for cybersecurity certification of ICT products, services, and processes across the EU.
- › **Scope:** Applies to manufacturers, developers, and distributors of digital products and services.

Key Requirements

- › **Certification Schemes:** Development of EU-wide certification schemes to ensure consistent cybersecurity standards.
- › **Security by Design:** Integration of cybersecurity measures throughout the product lifecycle.
- › **Market Surveillance:** Enhanced monitoring and enforcement of compliance.

Impact on Automotive Industry

- › **Increased Certification:** Ensures vehicles and components meet high cybersecurity standards.

EU Network Information Security Directive (NIS 2)

Regulation (EU) 2022/2555

Overview

- › **Purpose:** Enhance cybersecurity resilience across the EU.
- › **Scope:** Applies to essential and important entities, including the automotive sector.

Key Requirements

- › **Risk Management:** Implement measures to manage cybersecurity risks.
- › **Incident Reporting:** Mandatory reporting of significant incidents within 24 hours.
- › **Supply Chain Security:** Ensure cybersecurity throughout the supply chain.
- › **Penalties:** Fines for non-compliance, up to €10 million or 2% of global turnover.

Impact on Automotive Industry

- › **Enhanced Cyber Resilience:** Strengthens defenses against cyber threats.
- › **Compliance Obligations:** Requires automotive companies to adopt robust cybersecurity practices.
- › **Supply Chain Security:** Ensures end-to-end security in the automotive supply chain.
- › **Operational Changes:** Necessitates updates to cybersecurity policies and incident response plans.

EU Cyber Resilience Act (CRA)

Regulation (EU) 2024/2847

Overview

- › **Purpose:** Enhance cybersecurity for products with digital elements across the EU.
- › **Scope:** Applies to manufacturers, developers, and distributors of digital products.

Key Requirements

- › **Security by Design:** Cybersecurity must be integrated into the design, production, and lifecycle management of products.
- › **Compliance Demonstration:** Products must meet stringent cybersecurity standards. 
- › **Penalties:** Fines up to €15 million for non-compliance.

Impact on Automotive Industry

- › **Enhanced Product Security:** Ensures vehicles and components meet high cybersecurity standards.
- › **Supply Chain Security:** Mandates cybersecurity measures throughout the automotive supply chain.
- › **Operational Changes:** Requires updates to design, production, and maintenance processes to comply with the Act.

Industry-specific Regulations and Standards

UNECE Vehicle Type Approval

Have you seen this sign?

Neue EU-Regeln

Wieso einige Automodelle eingestellt werden

Stand: 19.03.2024 10:17 Uhr

Wegen neuer EU-Regeln für die Cyber-Sicherheit in Neuwagen nehmen mehrere Hersteller Modelle aus dem Programm. Mit dem Stichtag zum 7. Juli verschwinden etwa der VW Up und der Porsche Macan.

Den Kleinwagen Up von VW trifft es ebenso wie den Transporter T6.1 und die Porsche-Verbrenner Macan, Cayman und Boxster: Wegen strengerer EU-Regeln für die Cyber-Sicherheit im Auto, die ab Juli gelten, verschwinden sie vom Markt. Und für viele von ihnen gibt es keinen direkten Nachfolger.

"Für den deutschen Markt sind bereits alle Up produziert und an den Handel ausgeliefert", erklärt eine VW-Sprecherin. In anderen EU-Ländern laufe die Auslieferung der letzten Fahrzeuge dagegen noch bis Mitte des Jahres. Dann sei auch dort Schluss.

Porsche Macan erfüllt künftige Vorschriften für Cyber-sicherheit nicht

Porsche will im Frühjahr 2024 die Produktion des Macan einstellen. Grund dafür sind neue Vorschriften für die Cyber-sicherheit, die das SUV nicht erfüllt.

(Bild: Porsche)

14.12.2023, 16:23 Uhr Lesedzeit: 2 Min. Autos

von Martin Frenz

Porsche wird den Macan mit Benziner in der EU vorzeitig vom Markt nehmen, weil die Umstellung auf neue Zulassungsvorschriften zu aufwendig wäre. Die Plattform des Fahrzeugs werde nicht mehr auf die künftigen Regeln der EU umgestellt, bestätigte ein Sprecher einen Bericht der Stuttgarter Zeitung und Stuttgarter Nachrichten. Damit sei das Modell ab Anfang Juli 2024 nicht mehr zulassungsfähig. Der Verkauf soll bereits im Lauf des Frühjahrs eingestellt werden, sodass sichergestellt sei, dass die Fahrzeuge bis zum Stichtag ausgeliefert und zugelassen werden können.

UN Regulation on Type Approval for Cybersecurity

Potential Affected Markets of UNECE 1958 Agreement

UN Regulation on Type Approval

Affected Vehicle Categories

			CS	SU
	M₁	Passenger vehicles	X	X
	M_{2,3}	Busses	X	X
	N_{1,2,3}	Light and heavy duty trucks	X	X
	L_{6,7}	Light and heavy quadricycles If equipped with automated describing functionalities from level 3 onwards as defined in ECE/TRANS/WP.29/1140	X	
	O	Trailers If fitted with at least one electronic control unit	X	X
	R	Agricultural Trailers		X
	S	Interchangeable towed equipment		X
	T	Agricultural and Forestry tractor		X

Based on: TRANS/WP.29/1045

UNECE Regulation No. 155

Vehicle Type Approval with regards to Cybersecurity

Overview

- › **Purpose:** Establishes cybersecurity requirements for vehicles to protect against cyber threats.
- › **Scope:** Applies to all new vehicle types and models in UNECE member countries.

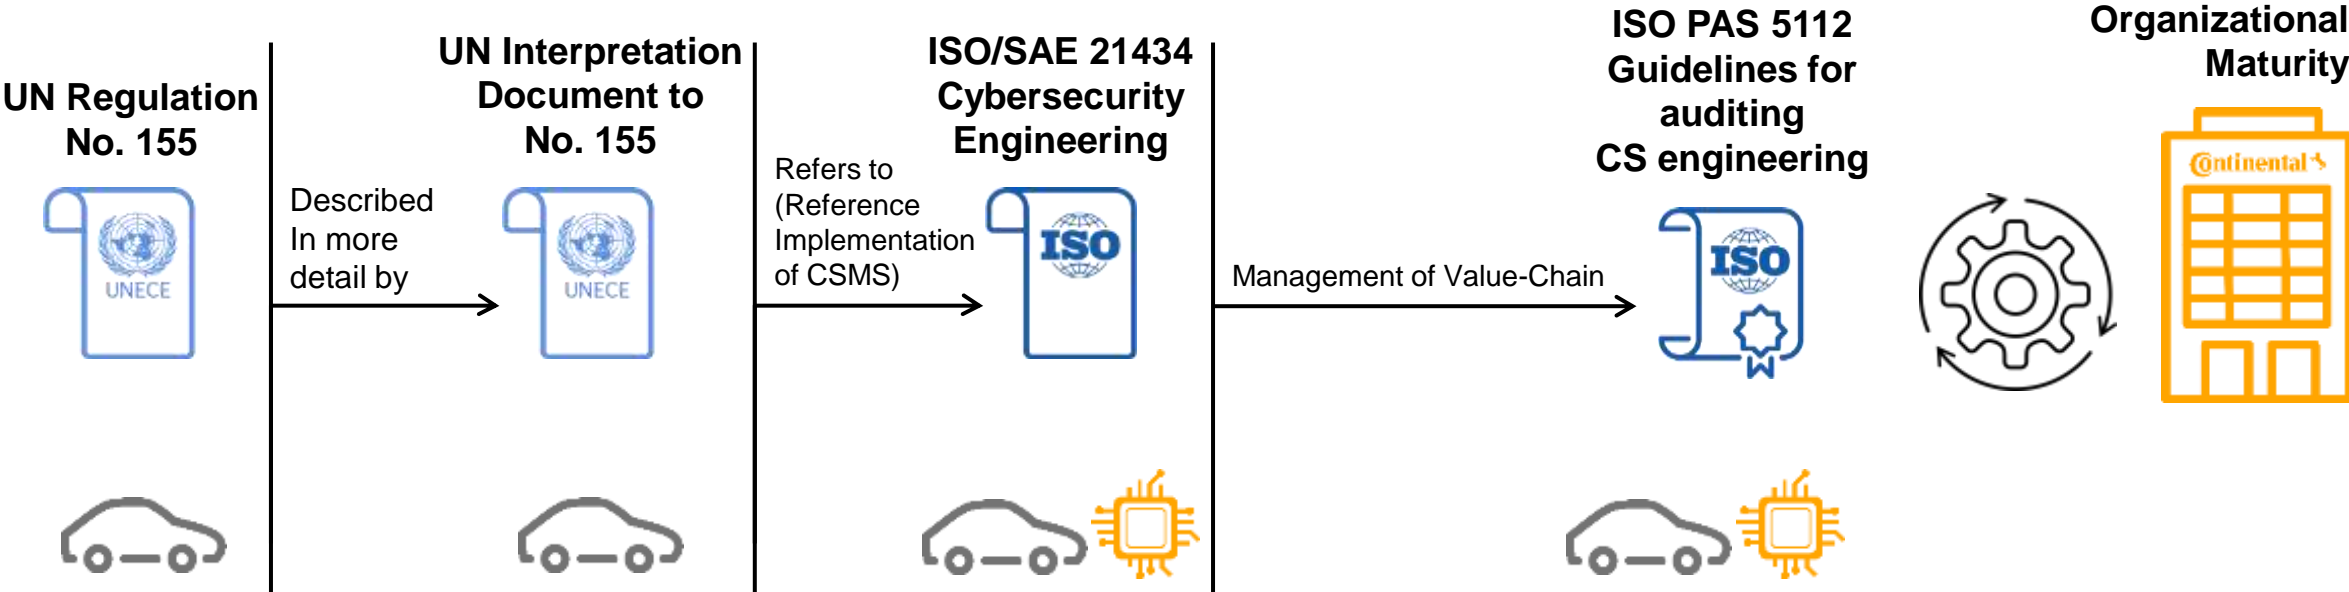

Key Requirements

- › **Cybersecurity Management System (CSMS):** Manufacturers must implement a CSMS to manage cybersecurity risks throughout the vehicle lifecycle.
- › **Risk Assessment:** Continuous identification, assessment, and mitigation of cybersecurity risks.
- › **Incident Response:** Procedures for detecting, reporting, and responding to cybersecurity incidents.
- › **Certification:** Vehicles must be certified for compliance with the regulation.

Impact on Automotive Industry

- › **Enhanced Vehicle Security:** Ensures vehicles are protected against cyber threats, enhancing overall safety.
- › **Compliance Obligations:** Requires manufacturers to adopt comprehensive cybersecurity practices and obtain certification.
- › **Operational Changes:** Necessitates updates to design, production, and maintenance processes to integrate cybersecurity measures.
- › **Consumer Trust:** Builds consumer confidence in the security of automotive products, improving brand reputation.

Baseline for the Supply-Chain

Overview

- › **Purpose:** Provides a comprehensive framework for managing cybersecurity risks in the automotive industry.
- › **Scope:** Applies to all stages of the vehicle lifecycle, from design and development to decommissioning.

Key Requirements

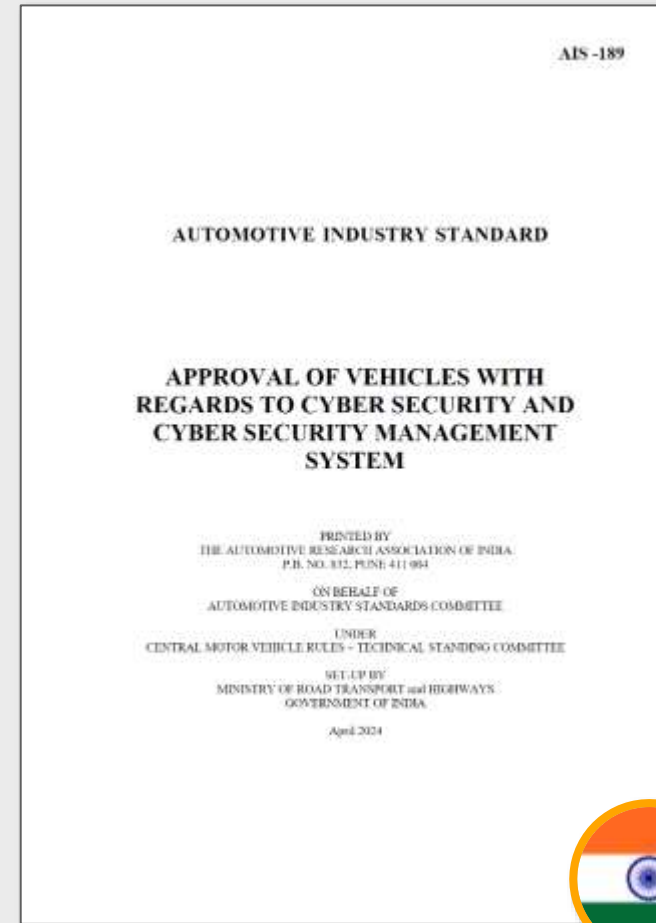

- › **Cybersecurity Management:** Establishes a dedicated cybersecurity management plan within organizations.
- › **Risk Assessment:** Identifies and evaluates potential cybersecurity risks specific to vehicles and their components.
- › **Security by Design:** Integrates cybersecurity measures from the early stages of vehicle development.
- › **Incident Response:** Implements protocols for effectively responding to cybersecurity incidents.

Impact on Automotive Industry

- › **Supply Chain:** Baseline for certification in the supply-chain to increase trust.
- › **Compliance Obligations:** Supports manufacturers to demonstrate cybersecurity practices along the supply chain.

International Regulations

UN Regulation and Standard is accepted on global Level

Implementation of a Robust CSMS at a Supplier

Actions to take to ensure Compliance and Conformity

A futuristic car interior is shown from the driver's perspective. The dashboard and steering wheel are visible, but the scene is dominated by a complex digital overlay. This overlay consists of a grid of blue lines, numerous floating binary digits (0s and 1s), and various data points represented by small circles and numbers. The overall aesthetic is high-tech and data-driven, representing the concept of a software-defined vehicle.

Software-Defined Vehicle

The Future of Mobility

Software-defined Vehicle

In a Software-defined Vehicle, functions are enabled by software.

Decoupling software from hardware enables swift and continuous development & implementation of new functions and software updates throughout vehicle lifetime.

This results in new requirements regarding – products, collaboration, development, system integration and ecosystem.

The focus is no longer only on hardware, which nevertheless has a significant importance, but more and more on all relevant building blocks of the Software-defined Vehicle.

Continental Automotive

Software-defined Vehicle – What Does That Really Mean?

Characteristics of a Software-defined Vehicle:

Decoupling software from hardware development

Software and hardware evolve independently from each other. Updating software doesn't necessarily mean upgrading hardware – the hardware can remain the same throughout the entire product life cycle.

Deliver new or additional software features

Software-defined Vehicles are providing new functions and services to existing devices as well as easing maintenance. Software can be reused across devices and vehicles.

Capture value with software solutions

When software updates provide new value cross-domain independent of hardware sales, Software-defined Vehicles can enable the monetization of the software value.

Hardware and system knowledge as well as our software know-how are key success factors for our customers.

Software-defined Vehicle and Road to Cloud Ecosystem

In a Software-defined Vehicle, additional functions are enabled by software:

Decoupling software from hardware enables swift and continuous development, testing & implementation of new functions and software updates **throughout vehicle lifetime.**

This results in new requirements – **server-zone architecture, connectivity, cloud-based mobility services**, time to market, changing business models, **software and hardware decoupling.**

That is why we speak of a Software-defined Vehicle.

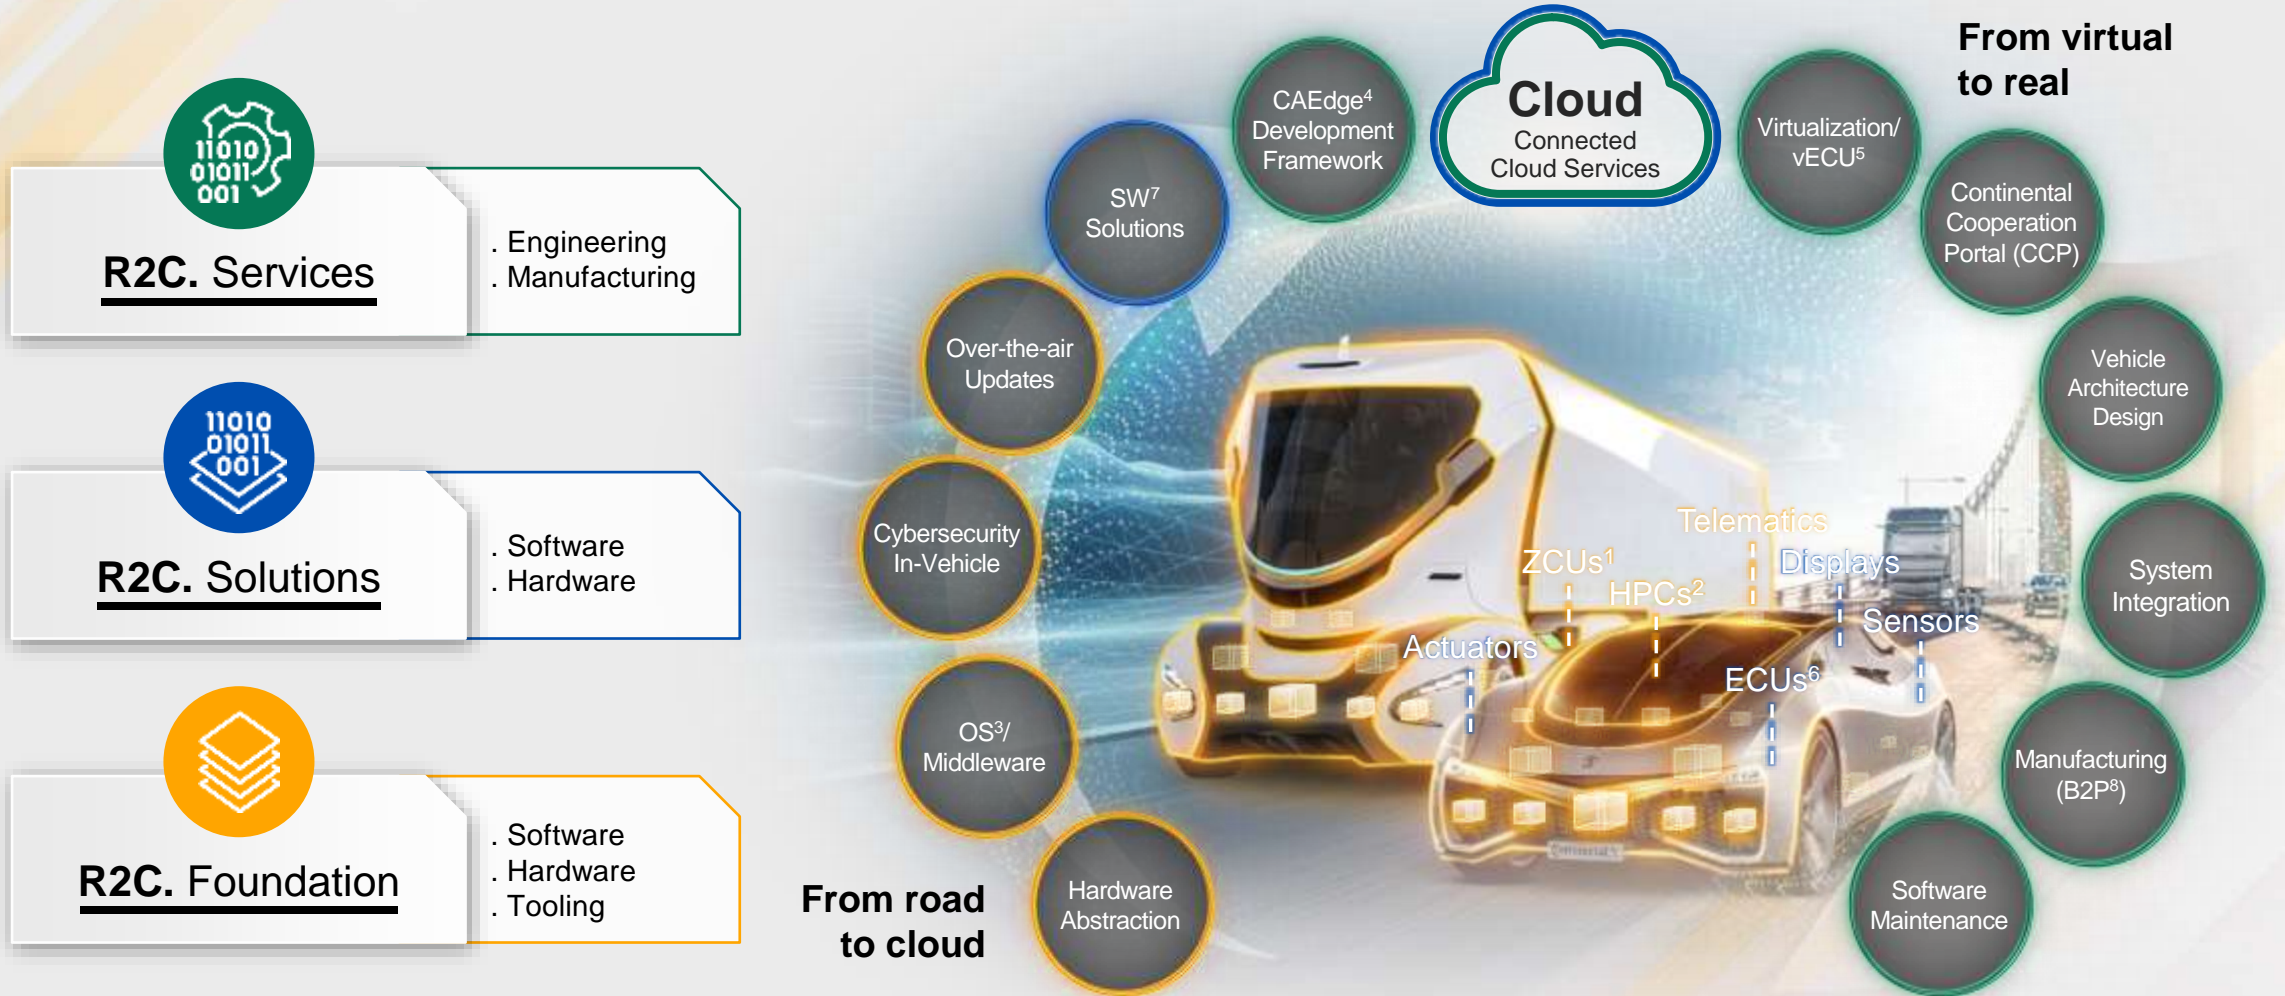

Road to Cloud (R2C.) Ecosystem:

Vehicles, which until a few years ago were a self-contained system, have become part of a much more **complex software-centric ecosystem** – the IoT.

In this ecosystem we can **capture value over the whole lifecycle of a vehicle.**

Road to Cloud Ecosystem

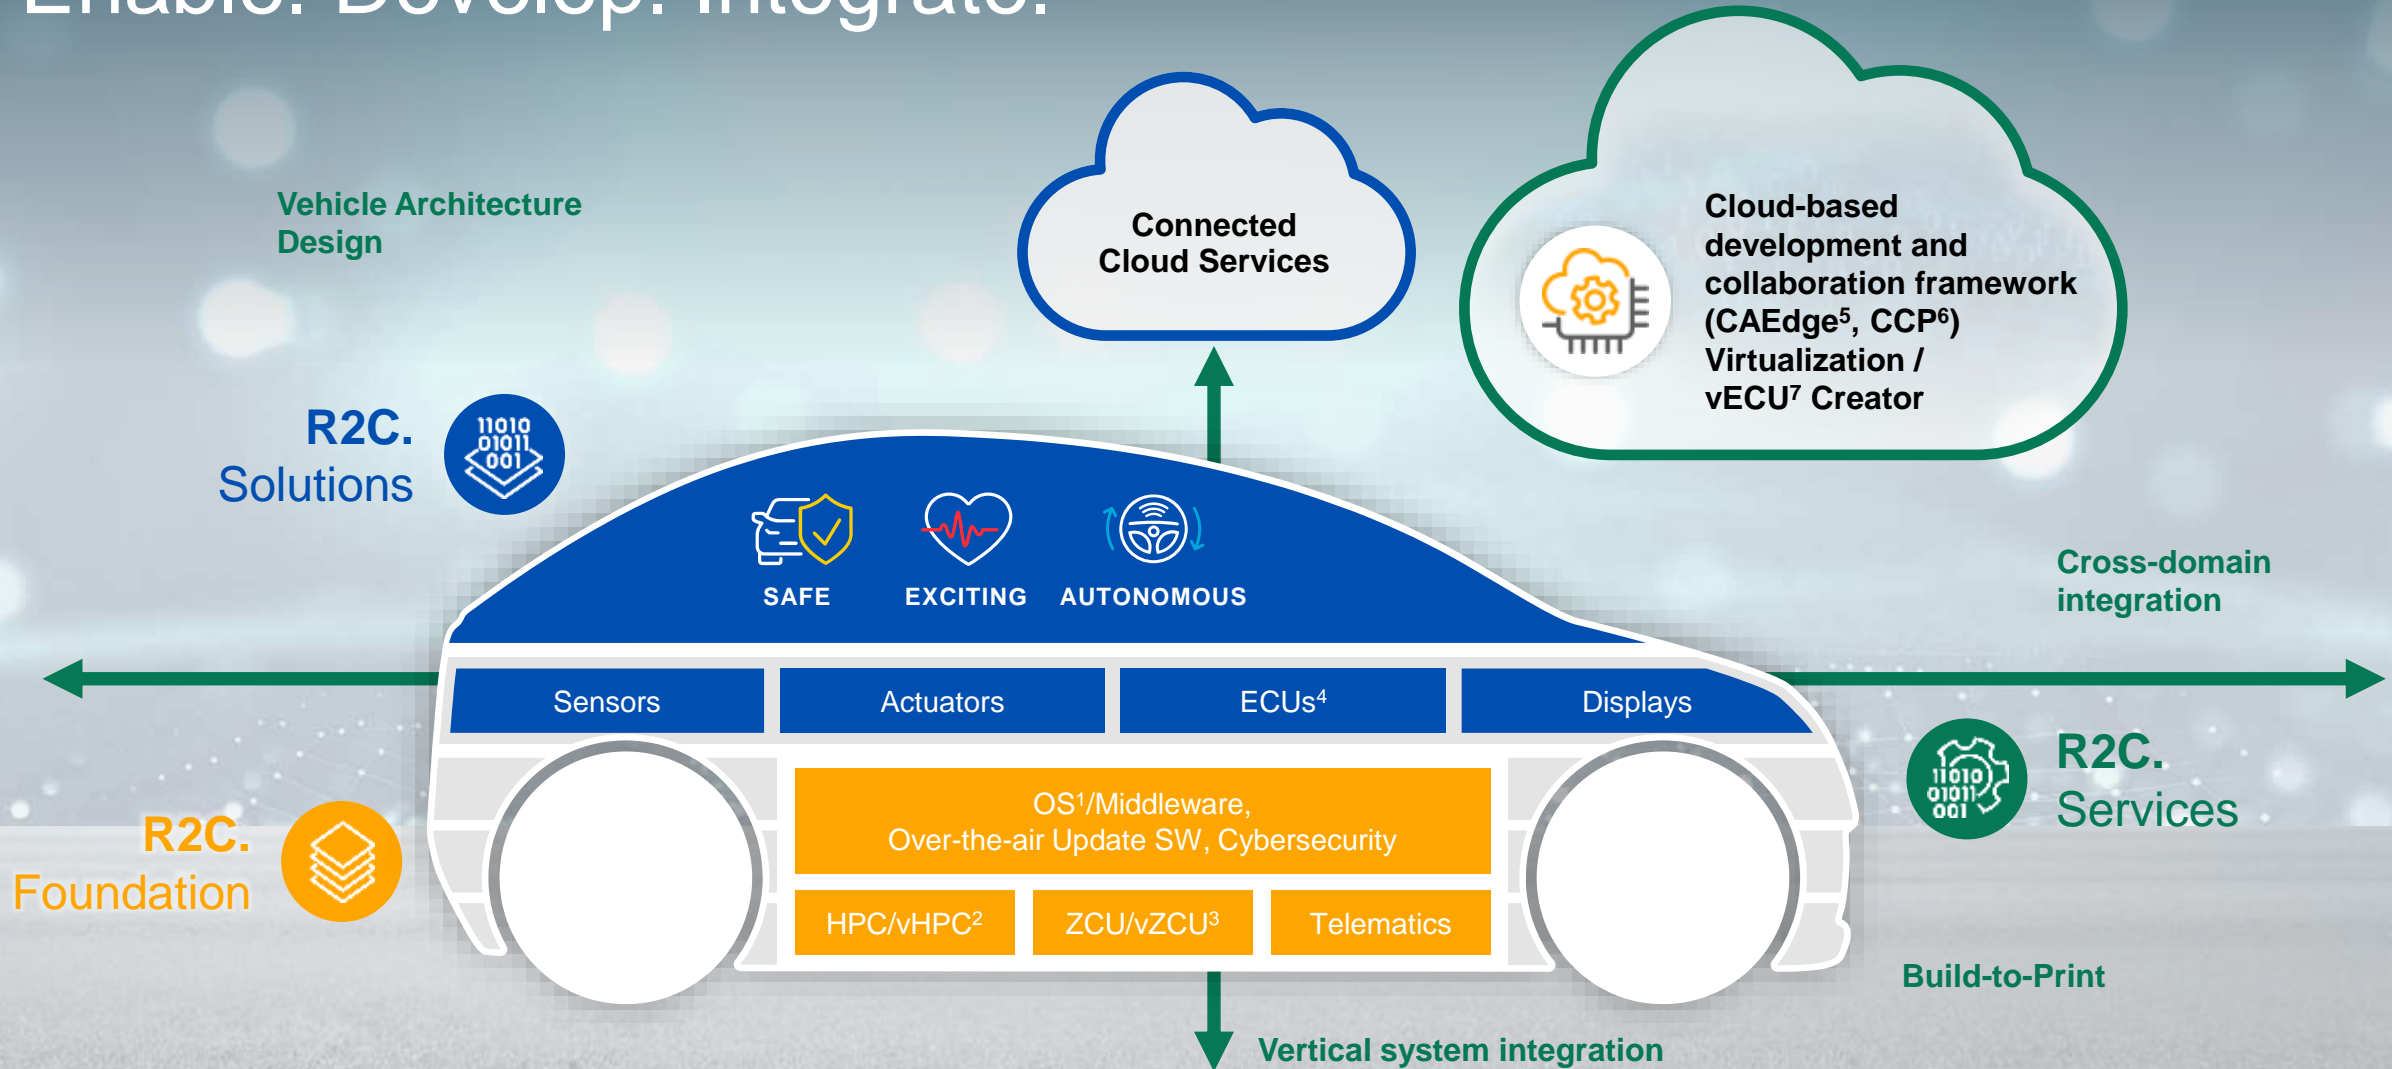

Solutions for the Software-defined Vehicle

¹ ZCU: Zone Control Unit, ² HPC: High-Performance Computer, ³ OS: Operating System, ⁴ CAEdge: Continental Automotive Edge Framework, ⁵ vECU: virtual Electronic Control Unit, ⁶ ECU: virtual Electronic Control Unit, ⁷ SW: Software, ⁸ B2P: Build-to-Print

Road to Cloud (R2C.) Ecosystem

Enable. Develop. Integrate.

¹ OS: Operating System, ² HPC: High-Performance Computer / vHPC: virtual High-Performance Computer,

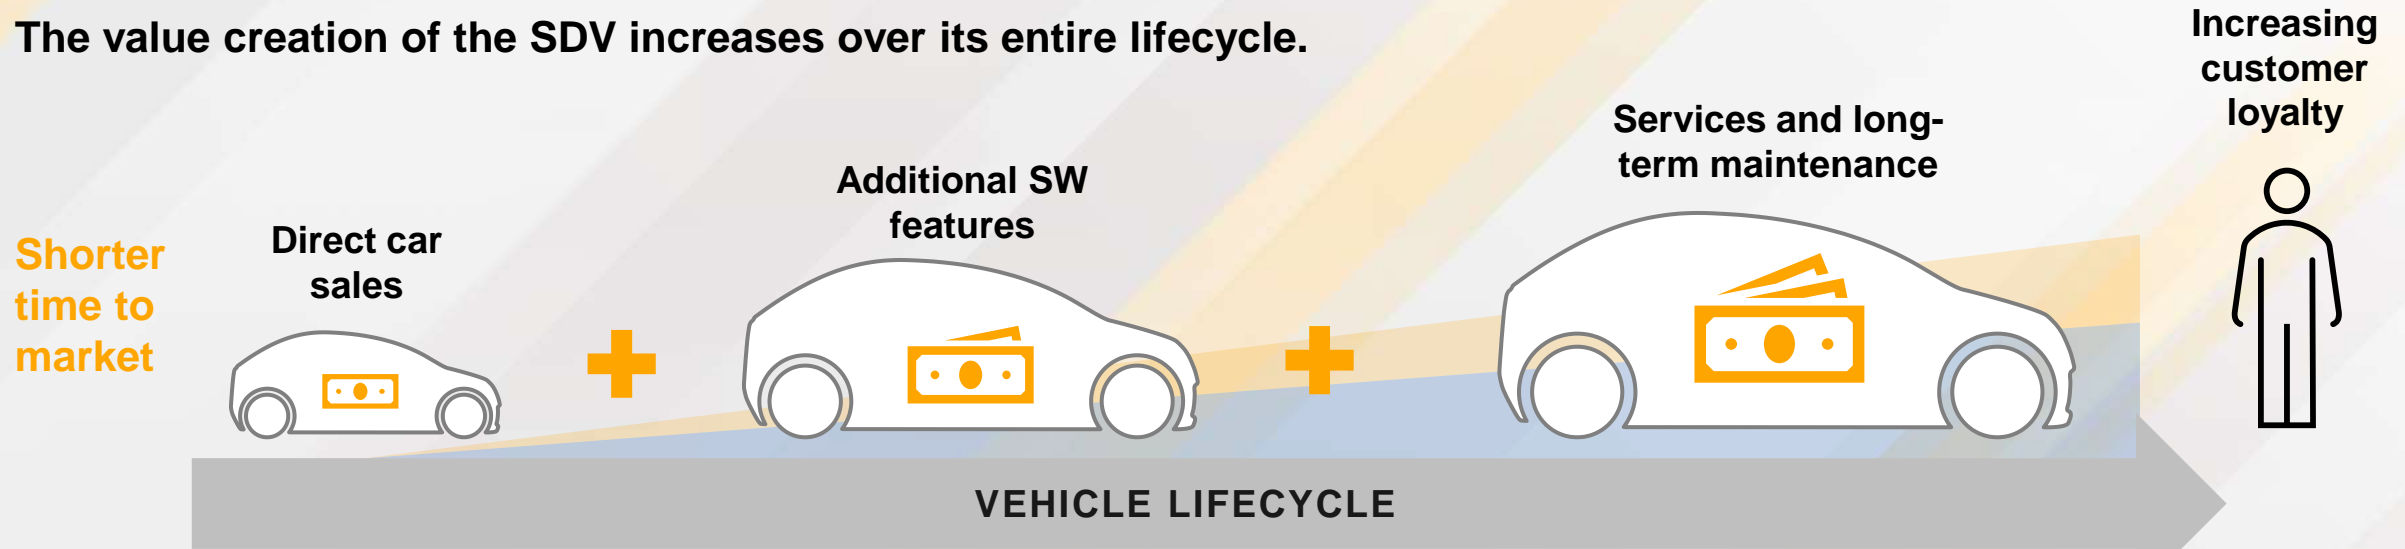

³ ZCU: Zone Control Unit / vZCU: virtual Zone Control Unit, ⁴ ECU: Electronic Control Unit, ⁵ CAEdge: Continental Automotive Edge Framework, ⁶ CCP: Continental Cooperation Portal, ⁷ vECU: virtual Electronic Control Unit

The Software-defined Vehicle

What Is the Value of a SDV for the OEM?

The Software-defined Vehicle (SDV) enables OEMs to create additional value by facilitating over-the-air updates, allowing continuous improvement and feature enhancements without requiring physical recalls.

The value creation of the SDV increases over its entire lifecycle.

Increasing direct and indirect revenue and customer loyalty

Data Protection and Privacy

Increasing Global Relevance by Local Regulations

All Automotive Products and Mobility Services need to meet Data Protection Regulations

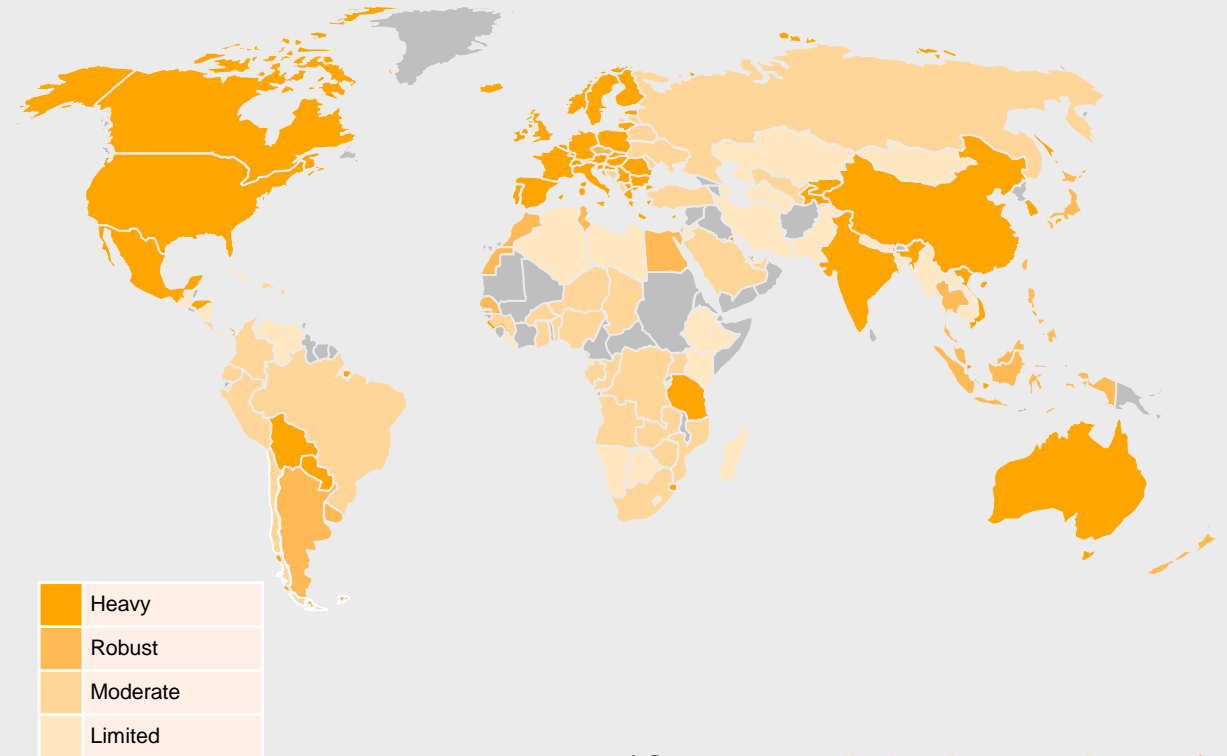

Data Protection laws worldwide are legally binding and **punishable with high sanctions** (Automotive GDPR violation with 1,2 Mio€ penalty)

Privacy Enhancing Technologies **are enablers** for future personalized Mobility Services and Automotive Products

Investing in privacy-friendly technologies can **increase business opportunities** and **build customer trust** relationships

AUTOPSY Research Project

Automotive Data-Tainting for Privacy Assurance System

The illustration shows a group of five people from behind, looking at a large presentation screen. The screen displays a stylized smart city scene with cars, pedestrians, and wireless signals. A central cloud icon contains two white arrows, one pointing up and one pointing down, representing data flow. To the left of the screen are several interlocking gears, symbolizing technology and engineering.

Goals

-  Create better understanding of Data flows in Automotive environments
-  Create Privacy-Aware System Model for an Automotive Use-Case in specific technical design

Use Cases

- › Silent Testing
- › Platooning
- › Pay as you Drive

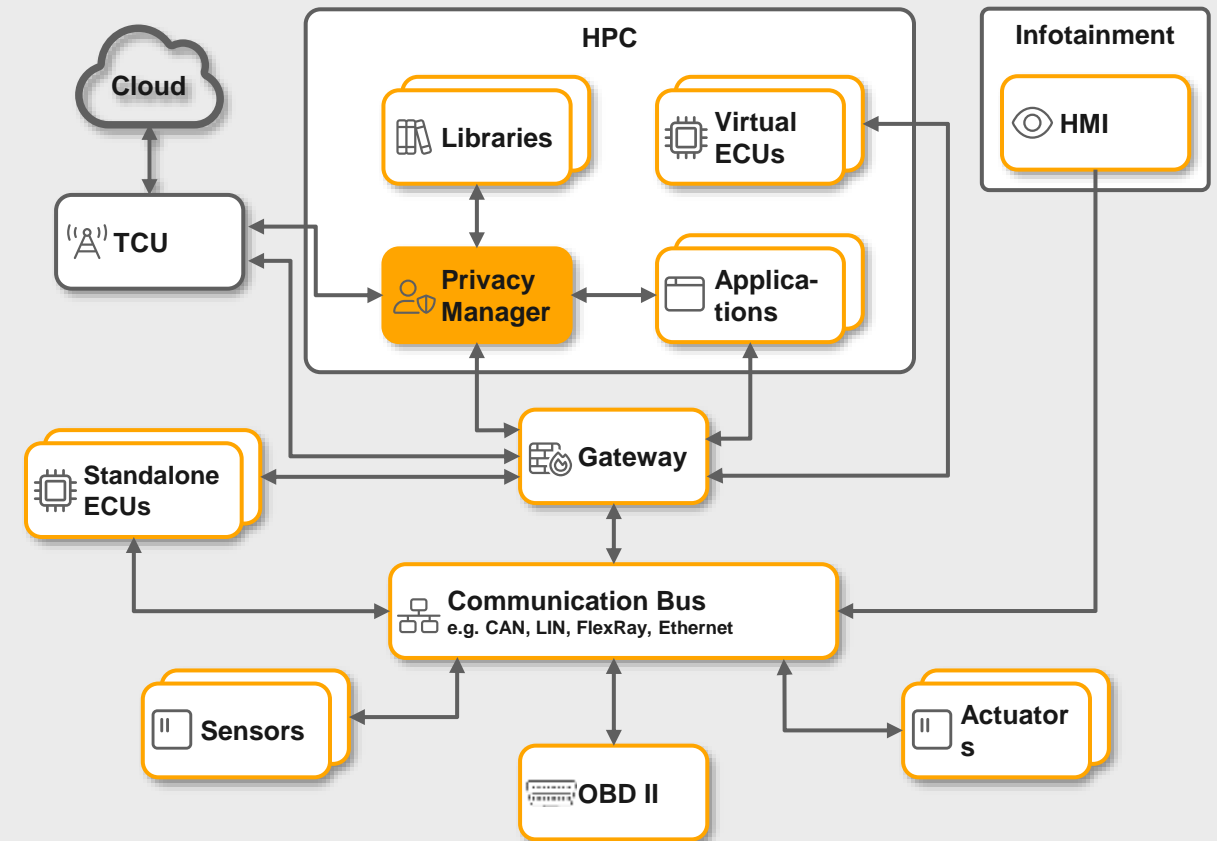

AUTOPSY Research Project

Application to Silent Testing Scenario

- › Purpose: Test method **leveraging data on AVs**
- › In real-world conditions on public roads,
 - › **without control** of the vehicle
 - › already released software version is running in parallel
 - › driver and passengers do not actively participate
- › **Safety validation** of an AV as main use case
- › Data collections vary highly with the specific monitoring and development goals.
- › Transfer of the data to the Silent Testing cloud backend

Privacy Manager

- › Application depends on target function
- › PETs: Add noise, encrypt, apply MPC
- › Separation of raw data most likely not applicable due to debug limitations

| AV: Automated Vehicle | MPC: Multi-Party Computation | PET: Privacy-Enhancing Technology |

Contemporary Cryptography

Asymmetric Cryptography is on Risk

Shor's Algorithm (1994)

- › Quantum algorithm giving exponential speed-up over classical computers
- › It can be used for Factoring large integers and Finding discrete logarithms

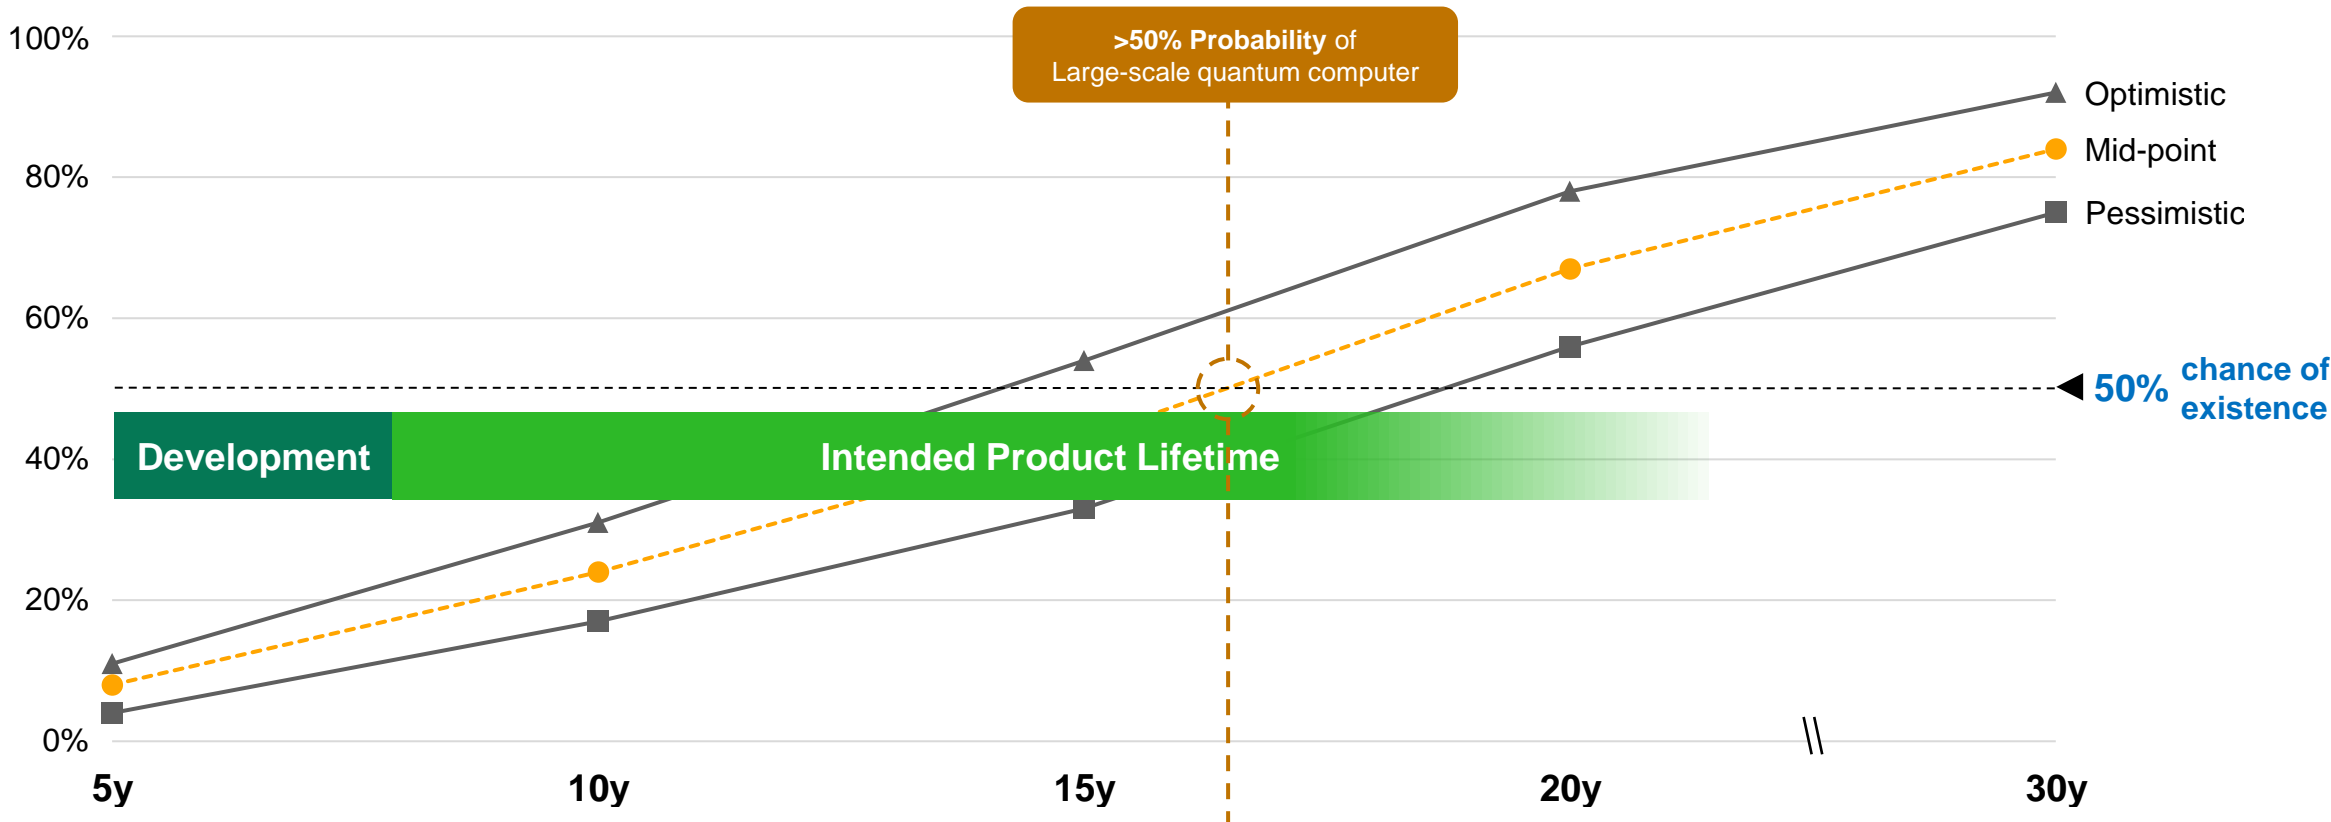

Grover's Algorithm (1996)

- › Polynomial speed-up in unstructured search, from $O(N)$ to $O(\sqrt{N})$
- › There is recent research to speed it up some more, but nothing feasible right now

Post Quantum Cryptography

The Status Quo will be on Risk

Opinion-based estimates of the cumulative probability of a digital quantum computer able to break RSA-2048 in 24 hours

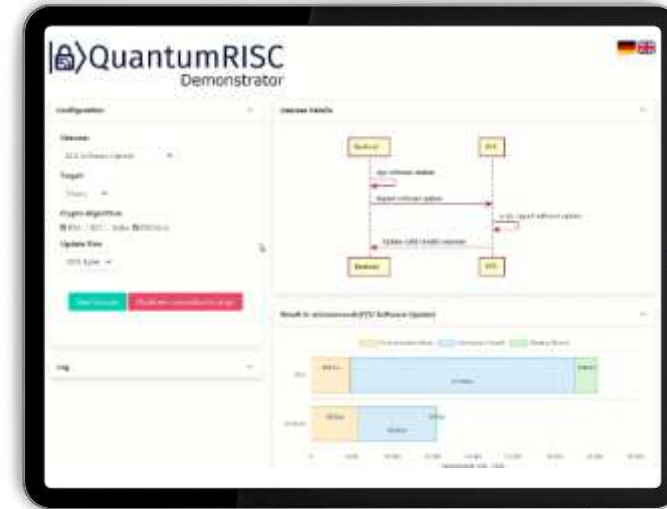

Adapted from Mosca and Piani, Quantum Threat Timeline Report 2023

Post Quantum Cryptography

Working towards Solutions in QuantumRISC Project

Goals of the Project

- › Definition of **common Automotive Use-cases**
- › Development of a **custom library** targeting embedded ECUs **containing post-quantum algorithms**
- › Implementation of the Use-cases in a server-client architecture
- › **Benchmarking** and **identification of requirements**

- › Implemented the Use-cases in an **End-to-End demonstrator**
- › End-to-End demonstrator based on **Elektrobit AUTOSAR Classic library** containing Kyber and Dilithium
- › Integrated on 32-bit AURIX™ TriCore™ microcontroller from Infineon

Post-Quantum Demonstrator

The screenshot displays the QuantumRISC Demonstrator interface. The top left features a logo with a padlock icon and the text "QuantumRISC Demonstrator". The top right shows German and UK flags. The interface is divided into two main sections: "Configuration" and "Usecase Details".

Configuration:

- Usecase:** ECU Software Update
- Target:** Tricore
- Crypto Algorithm:** RSA ECC Kyber Dilithium
- Update Size:** 1024 Bytes

Buttons: "Start Usecase" (green), "Shutdown connection to target" (red)

Usecase Details:

A sequence diagram illustrating the update process between a Backend and an ECU:

- The Backend sends "sign software update" to the ECU.
- The ECU sends "signed software update" back to the Backend.
- The ECU sends "verify signed software update" to the Backend.
- The Backend sends "Update valid/invalid response" back to the ECU.

The numbers shown in this video are preliminary.

Post Quantum Cryptography Research Conclusions

- › **Migration** to PQC is **not straightforward** since no “one-size-fits-all” solution exists
- › **Crypto-Agility** in the Automotive world is **not that easy** to achieve due to e.g., processes, hardware constraints, performance and security considerations
- › Depending on the use-case, **PQC algorithms can be faster** than pre-quantum ones while they tend to **require more hardware resources** (ROM & RAM)
- › We are working on **providing solutions** to support a **sustainable Cybersecurity** of Continental’s and our customer’s products.
